REPORT

TO

The Right Honourable Sir GEORGE GREY, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
31*st May* 1865.

I HAVE the honour to submit to you the detailed abstracts of the marriages, births, and deaths that have been registered in England and Wales during the year 1863.

347,020 persons married, 727,417 children were born alive, and 473,837 persons died. Thus the names of 1,548,274 persons were added during the year to the registers deposited and indexed in the office: it is the greatest number ever recorded in one year, and raises the total number to nearly *thirty-four millions* since the commencement of registration in 1837.

The natural increase of population by the excess of births over deaths was 253,580, or nearly 700 daily. In the middle of 1863 the population

TABLE I.—Estimated **Population,** with the Number of **Marriages, Births,** and **Deaths** registered in **England,** in each **Year** from **1838** to **1863.**

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of the Years.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS.	EXCESS OF BIRTHS OVER DEATHS.

1862	20,336,467	164,030	328,060	712,684	436,566	276,118
1863	20,554,137	173,510	347,020	727,417	473,837	253,580

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

of England and Wales probably exceeded *twenty and a half millions.* The number of emigrants who left the ports of the United Kingdom at which Government agents are stationed during the year was 223,758; of whom 67,926 were of English origin, 18,709 of Scotch, 127,920 of Irish, and 9,203 were foreigners: the numbers are corrected proportionally for the 23,061 whose birthplace was not recorded. Of the emigrants 146,813 departed for the United States, 18,083 for the North American colonies, 53,054 for the Australian colonies, and 5808 for other places.

Marriages.

The cloud passing over the cotton manufacturing districts in 1861 and 1862 was reflected at once in the marriage registers, and the rate which in 1860 was as high as 1·710 persons married to every 100 persons living, was reduced to 1·628 in 1861, and further to 1·614 in 1862. In 1863 the crisis had passed: after a bountiful harvest the people began to think more favourably of their prospects, and marriage proceeded at an augmented rate, the proportion to every 100 persons living rising to 1·688, while the average of the last 26 years was 1·640.

The average price of wheat per quarter, which was 55*s.* 5*d.* in 1862, had decreased to 46*s.* 7*d.* in the March quarter of 1863, and was as low as 40*s.* 6*d.* on the average of the last three months of the year. The average number of paupers relieved on the *last day* of each week during the first quarter of 1863 was, in-door 142,257, and out-door 943,324; the numbers falling to 130,072 and 804,940 respectively, in the last quarter of the year. This evidence of the growing prosperity of the people received additional force from the increase in the marriage rate.

Of the 173,510 marriages, the numbers solemnized according to the rites of the Established Church were 136,743; of which 19 were by special licence,

Mean . .	·820	1·640	3·373	2·223	122	61	30	45

Note.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results.

19,298 by licence, 109,572 by banns, 4,312 by Superintendent Registrar's certificate: in 3,542 instances it was not stated under which of the foregoing headings the marriages should be classed.

36,767 of the marriages were *not* performed according to the rites of the Established Church; 8,095 were among Roman Catholics, 14,714 among members of various Christian denominations, 51 among Quakers, and 318 among Jews; 13,589 were performed at Superintendent Registrars' offices. The marriages among Quakers show an almost yearly decline, while those among the Jews exhibit an increase. Table III. gives, in a comparative statement, the number of marriages under each head since the year 1841, and

Table III[a]. shows that of the 36,767 marriages *not* according to the rites of the Established Church, 4202 were by licence granted by the Superintendent Registrar, and 32,565 by Superintendent Registrar's certificate. The respective numbers in each county are also shown in the Table.

Re-marriages.—23,494 widowers and 15,307 widows re-married during the year; of the former 15,269 allied themselves to spinsters and 8225 to widows; the remainder of the widows re-marrying (7082) were espoused by bachelors. 13·5 per cent. of the men who married had been previously married, while among the women who married 8·8 per cent. had been previously wedded. These proportions are below those of any year since 1852. The Tables given at pages 26 and 27 are interesting and worthy of study; they show the ages and civil condition of the contracting parties.

Minors.—A belief is sometimes expressed that people marry later in life than they did formerly; but if this is the case in certain classes of society it does not obtain among the people generally, for the proportion of young persons who marry has never been so high as during the year 1863; and with very few exceptions the rate has been annually increasing for more than 20 years. In 1841, in every 100 marriages, 4·38 of the men and 13·29 of the women were under 21 years of age; in 1863 these proportions had risen to 6·61 and 19·90 respectively. The counties in which the greatest proportions of young persons married are Buckinghamshire, Northamptonshire, Huntingdonshire, Bedfordshire, Cambridgeshire, Staffordshire, Leicestershire, West Riding of York, and

Durham. The counties showing the smallest proportions are Middlesex (extra Metropolitan), Herefordshire, Shropshire, Rutlandshire, North Riding of York, Northumberland, and North Wales. The relative tendency, however, to early marriage in different places can only be measured by the proportions which the marriages of minors bear to the numbers living unmarried at corresponding ages.

Signatures of persons married.—132,248 men and 116,094 women wrote their names; 41,262 men and 57,416 women signed the marriage register with marks. *Seventy-six* in 100 men wrote their names and 24 made marks. In 100 women *sixty-seven* wrote their names and 33 made marks. These proportions are precisely the same as in the previous year, and cannot be regarded as satisfactory; the 12 preceding years show a continuous decrease in the percentage of those who signed with marks. London heads the list with proportions of 89 in 100 men and 82 in 100 females signing their names. The extra-metropolitan portions of Surrey,

1850	·860	5·666	·129	·731	40 3
1851	·858	5·591	·130	·728	38 6

* Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; of these, 135 may be taken to represent the marriages of the higher and middle classes, and 669 those of the classes below.

Kent, and Middlesex also show a large proportion who signed their names, as likewise do Sussex, Hampshire, Devonshire, Gloucestershire, Yorkshire, and the northern counties; in Monmouthshire and Wales the state of education, measured by this standard, is very defective. In England and Wales there were 26,626 instances in which both the bride and bridegroom signed the register with marks; and there were 45,426 alliances where one signed by name and the other signed by mark. Half of the women who married in Wales and Lancashire signed with marks.

Buildings registered for the solemnization of marriages.—During the year 1863 200 additional places of worship were registered for the solemnization of marriages therein, under the Act 6 & 7 Will. 4. c. 85.; of these, 25 belonged to the Independents, 40 to the Baptists, 88 to various denominations of Wesleyan Methodists, 16 to Welsh Calvinistic Methodists, and 15 to Roman Catholics. In 1862 the number of buildings registered was 190. At the close of 1863 there were 4954 buildings on the register, including 1554 belonging to the Independents, 1066 to the Baptists, 1049 to the Wesleyan Methodists, and 587 to the Roman Catholics. The distribution of the registered buildings will be seen in the Table. (See Table VIII.)

The marriages in registered buildings in 1863 were 22,809; in the 337 buildings in London 2369 marriages were solemnized, including 1460 marriages in Roman Catholic chapels; in the 651 buildings in the North-western division (Cheshire and Lancashire) there were 5590 marriages, 3431 of which were celebrated in Roman Catholic chapels. In Monmouthshire and Wales, where the registered buildings are the most numerous, 2760 marriages were celebrated in the 780 chapels, namely 303 of Roman Catholics, and 2457 of other denominations. With regard to marriages in Roman Catholic chapels, it may be remarked that in some instances one of the parties to the marriage is a Protestant. In certain cases couples are married twice and their marriages are twice registered.

TABLE V.—**Marriages** in **England**. The Proportion per Cent. of **Minors** of each Sex, of Males and Females who **signed the Register with Marks**, and of Persons who were **Widowers** or **Widows**, in each **Year** from **1841** to **1863**.

* The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

During the year 1863 80 new district churches and chapels-of-ease were licensed for marriages according to the rites of the Established Church.

42	Monmouthshire	·857	58·8	51·1	6·59	22·44	12·59	10·90
43	South Wales	·786	64·9	45·8	5·87	17·51	13·16	8·56
44	North Wales	·758	64·5	51·9	4·25	11·87	14·32	7·55

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 844 marriages took place; of 1,000 men married 762, of 1,000 women 669, signed the marriage register by writing their names; of 10,000 men married 661 were not of full age, of 10,000 women married 1990 were not of full age; of 10,000 men married 1354 were Widowers of the same number of women married 882 were Widows.

Births.

The names of 727,417 living children were inscribed in the registers of births during the year 1863, a number exceeding by 14,733 those recorded in the previous year, and more than a *quarter of a million* in excess of those registered in 1838, the first complete year of registration. The number of births, as well as the proportion to the population, has never been so high; the average rate of birth is 3·333 to every 100 persons living; it rose to 3·504 in 1862, and still further, to 3·539 in 1863, being one birth to every 28 persons living. As in previous years Durham exhibits the highest birth-rate (4·207 per cent.), and Herefordshire has the minimum rate (2·981 per cent.)

Sex.—372,019 of the births registered were those of male children, and 355,398 those of female children, so there were 104·7 males born to every 100 females born. Cumberland had the unusually high proportion of 112 males, Monmouthshire had 111, Huntingdonshire 110, and Westmorland 109, to 100 females born. In Berkshire, Rutlandshire, and the North Riding of Yorkshire more females than males were born, the respective numbers being 99·7, 99·5, and 99·6 to every 100 females born.

Seasons.—In the first quarter of the year 186,341 births were registered, in the second quarter 189,340, in the third quarter 173,439, and in the last quarter 178,297. If the average number of births in a quarter be represented by 1000, then there were in the first quarter 1039, in the second 1043, in the third 946, and in the last quarter 972.

Children born out of wedlock.—47,141 children, namely, 24,288 boys and 22,853 girls, were born out of wedlock in 1863. The proportion is 6·5 born out of wedlock to 93·5 born in wedlock to every 100 births, or nearly as 1 to 14. The proportionate number is in excess of the two years preceding, when it was 6·3 per cent. The proportion of illegitimate births

*Chiefly belonging to the "United Methodists Free Church."

Shropshire (10·1 per cent.), the whole of the North-midland counties, Cheshire, East and North Ridings of York, Northumberland, Cumberland (with the maximum rate of 12·0 per cent.), Westmorland, and North Wales. A rate of illegitimacy far above the average has, in successive reports, been shown to prevail in certain counties, and it is a matter for surprise that so little attention has been paid to this important subject. Local knowledge and investigation might possibly detect a cause in prevailing social habits; and the cause being ascertained the first step is gained towards an amelioration. A good field is open for inquiry and reform, and he will be a public benefactor who helps to purge his county of this moral stain.

Deaths.

The deaths in 1863 were 473,837. If the facts are stated roundly, the number exceeded that of the year 1860 by 51,000, that of 1861 by 39,000, and that of 1862 by 37,000. The number of English funerals approached half a million.

The excess of births over deaths was 253,580.

The rate of mortality was 2·305 per cent. against an average rate in 26 years (1838–63) of 2·228. After a period of health embracing three years (1860–2), when the annual mortality was less than 2·2 per cent., and in the first of those years only 2·124, fatal causes began to operate, and the effect was a mortality higher by ·181.

Sex.—The numbers of males and females who died in the year were, respectively, 242,203 and 231,634. The death-rate of males was 2·424 to 100 males living; that of females 2·193 to 100 females living. The averages of 26 years are: 2·314 per cent. for males; 2·145 for females. For every 100 females who died in the year there were 105 deaths of males. But this proportion is derived from the deaths of males and females as they occurred in unequal populations of the sexes, the females living in England being considerably in excess of the males. If a town or province were found in which the two sexes mustered equally strong, the greater mortality of males would give 111 for every 100 deaths that occurred amongst females.

Females suffered less than males from the insalubrious influences peculiar to the year; the female mortality showing a less excess above its average than did the mortality of males.

Table IX.—**Births** in the **Years 1845–63** in **England,** distinguishing the **Legitimate** and **Illegitimate.**

Locality.—It has been remarked that the mortality of England was 2·305 per cent. But the death-rates in London and the several counties, of which this is the average, showed many degrees of variation ranging from the lowest in Westmorland, 1·735, to the highest which occurred in Lancashire, and was 2·629. Of the three Yorkshire Ridings the unhealthiest was the West, in which the mortality was 2·573; the next

the East, where it was 2·529; the healthiest the North Riding, where the rate was 2·104. The health of London was less favourable in the three years 1861–3 than it had been in the two previous years; and in 1863 the mortality rose to 2·447, which is higher than it had been in any year since 1854, when cholera raged in the metropolis.

The counties in which the mortality was 1·7 and below 1·9 were Westmorland, Herefordshire, and the extra-metropolitan part of Surrey. In

Dorsetshire the death-rate was 1·981. In Huntingdonshire it was 2·332; in Warwickshire 2·307; in Staffordshire 2·371; in Cheshire 2·396.

In almost all the counties, as well as in London, the mortality was above the average. The following furnish the only exceptions to the rule:—Hampshire, Herefordshire, Staffordshire, Nottinghamshire, Derbyshire, Westmorland, Monmouthshire, and South Wales. Such instances are so few that the causes of the high mortality may be assumed to have

been chiefly zymotic, or in the air and water, for they exercised an influence almost universal. Leicestershire and Gloucestershire suffered remarkably. But in Cornwall the result was extraordinary; with an average mortality of 2·057 per cent., and a mortality varying little from that in the previous nine years, the rate rose in 1863 to 2·532 per cent.

Deaths of males at different ages.—The mortality of boys under five years of age was unusually high; it was 7·743 per cent., the average of 26 years being 7·236. In that series of years there were only seven instances in which the mortality exceeded 7·500; three in which it exceeded the high rate of 7·700. In the next quinquennial period (5–10 years) the mortality 1·031 was also above the average. At that age it is seldom as high as one per cent. In the next three periods, which, except the first, are decennial, extending to 35 years, the death-rate differed little from the average. In 35–45 the mortality was 1·330, and exceeded the average. In the next two decennial periods the rates, 1·729 and 3·055, were below their averages. In 65–75 the rate, 6·924, exceeded the average; in 75–85, 14·084 was less than the average, 14·658; in 85–95 there was 31·245 against 30·368; and at 95 years and upwards the rate rose to 48·848 against 43·770. In each of the three decennial periods, 65–95, the mortality rather more than doubles itself on that of the period immediately preceding. The results thus obtained, together with those derived from a comparison of the facts of 1861, 1862, and 1863, prove that the unhealthy influences of 1863 spent themselves chiefly on children.

Deaths of females at different ages.—In all the periods of life, except those 10–15; 15–25 years, the mortality of females was below that of males. Under five years the mortality of females was 6·715 per cent., being 10 in a thousand less than that of males. The conclusion, drawn above, that

Average of 26 years, 1838–63	2·314	2·145	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·342 deaths of males; to every 100 females living there were 2·146 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

children were the chief sufferers, appears to be also justified by the mortality of females at the several ages.

Seasons.—In the March quarter there were 128,096 deaths; in that of June 118,121; in the September quarter 112,504; and in the December 115,116. If the deaths in the year had been only 1000, while the same quarterly proportions were maintained, the numbers would have run in

	XI.—MONMOUTHSHIRE AND WALES.											
42	Monmouthshire	2·487	2·355	2·037	2·161	2·465	2·412	2·026	2·100	2·106	2·125	2·227
43	South Wales	2·219	2·230	2·004	2·004	2·412	2·289	2·116	2·052	1·997	2·050	2·137
44	North Wales	1·962	2·145	1·894	1·938	2·026	2·047	2·225	2·098	2·189	2·171	2·070

the four seasons as follows: 274, 250, 236, 241. The mortality was high in each quarter. In the first, it was 2·538 per cent. against the average 2·487; in the second 2·308 against 2·221; in the third 2·169 against 2·040; and in the last quarter 2·213 against 2·171.

Meteorology.—The mean temperature of the air at Greenwich in each month till May showed a clear excess above the average. In May, June, and July it was depressed below its average; in August was slightly above it, but again experienced a decided fall in September. In the subsequent three months the air was warm. The mean temperature of the year was 50·3°, or 1° above the average of 22 years. But though the winter, except part of March, was uncommonly mild, it was far from healthy. The rain-fall was 19·8 inches in the year, or 3·8 inches less than the average.

Summary of the Quarterly Reports, 1863.

First Quarter.—January, February, March.

The birth-rate was unusually well maintained last quarter; and it has been high during several successive corresponding quarters. The marriages in the first quarter of the year were more numerous than in the two previous corresponding quarters, a result which the metropolis appears to have mainly helped to produce. In the last Quarterly Report it was shown that the mortality was high; and the returns since obtained furnish equal evidence that in the first quarter of the present year the public health has not improved. The cold weather of November was

* For mode of reading this Table, see Note to Table XVII.

NOTE.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841-61.

fatal to many persons, and the effects of that month were probably not unfelt after the year had closed ; and also causes that were proper to last quarter rendered it more unfavourable to health than many seasons that were less remarkable for their mildness.

Marriages.—The marriage-rate in the first quarter of the year was 1·408 per cent., or, as it may be stated, if the same rate were in operation for a year 1408 persons would be married in that time out of every hundred thousand of the population. The average rate per cent. in the same quarter in ten years is 1·394. Following the Christmas quarter, in which the greatest number of marriages are celebrated, the period to which the present returns relate is that in which they are always found to be fewest.

The number of marriages reported is 35,528, against 33,274 and 33,953 in two previous March quarters. In London marriages were 5305 and 5737 in 1861–2 ; in the present year they rose to 6275. There was also an increase on both the previous corresponding quarters in the South-eastern Counties, the South-western, and the West Midland Counties, in Yorkshire, and the Northern Counties. Lancashire exhibits a revival in its marriages as compared with those in the first quarter of 1862 ; for in three periods taken in the order of time they were in that county

1858	2·390	7·683	1·052	·503	·766	·928	1·253	1·734	3·045	6·795	14·696	31·771	47·726
1859	2·327	7·499	·926	·478	·736	·920	1·255	1·735	3·018	6·644	14·019	29·376	43·747
1860	2·218	6·758	·683	·414	·712	·905	1·270	1·725	3·091	7·042	15·159	31·133	43·732
1861	2·268	7·176	·674	·433	·728	·923	1·265	1·690	3·008	6·890	14·654	31·092	44·835
1862	2·249	6·963	·770	·444	·717	·936	1·283	1·729	3·031	6·757	14·060	29·846	36·579
1863	2·424	7·743	1·031	·503	·739	·968	1·330	1·729	3·055	6·924	14·084	31·245	48·848

The Table may be read thus :—Of 100 males living of the age 35 and under 45, 1·358 died in 1838, 1·265 in 1839, and 1·162 in 1850 ; the average annual rate in the 26 years, 1838-63, among the aggregate of males in this decennial period of age was 1·274.

5431, 4882, and (this year) 5245. The increase is very considerable in Liverpool and West Derby, which have been comparatively unharmed by the prevailing distress.

The following districts of the cotton manufacture exhibit an increase in the marriages over those of one or both previous quarters :—

March quarter	1861	1862	1863
Prescot	113	134	145
Ormskirk	69	59	76
Chorlton	131	91	129
Salford	143	126	155
Manchester	951	829	1005
Clitheroe	36	28	42
Blackburn	259	216	237

The following are examples of decrease :—

March quarter	1861	1862	1863
Warrington	84	99	73
Bolton	305	312	231
Bury	210	173	153
Barton-upon-Irwell	81	80	59

In some of the above instances, as in many others throughout the country, fluctuations of the marriages in particular districts are probably caused by movements of the population.

Births.—The number of births in the quarter that ended 31st March was 186,341. In the same period of 1861 it was about 172,933 ; in that of last year it was 181,990. The annual birth-rate of the quarter (births to population) was 3·691 per cent., being higher than the average, which is 3·594. It was higher than it had been in any quarter during the course

of ten years, 1853–62, except the spring quarter of 1854 and the winter quarter of 1860.

If the last two winter quarters are compared in respect to births, it will be found that those of 1863 were more numerous than those of 1862 in all the eleven divisions, except that which is the seat of the cotton manufacture; unless the Northern Counties, where there was a trifling decrease, constitute another exception. Not only have marriages been comparatively few in Lancashire, but the removal of families from that county in quest of employment has been of sufficient importance to reduce the registration of births in the parts which they have forsaken.

Increase of Population.—The births of last quarter were in excess of the deaths in the same time by 58,245. The population would have received an accession amounting to 647 daily, if immigration and emigration had been equal to each other.

The total number of English, Scotch, Irish, and Foreign emigrants who left ports where there are Emigration officers, in the quarter ended 31st March, was 37,806. This emigration is superior in amount to that of any March quarter since 1854. The Australian Colonies attracted an increased number of settlers; but the United States, to which 24,900 persons sailed, were the place of destination to a great majority. Upwards of 17,000 natives of Ireland went to the United States in the quarter.

The emigration to the United States was more than three times as great as it was in the same period of 1862.

The number of English emigrants to all parts was about 10,075.

Prices, the Weather, and Pauperism.—Wheat was cheap. The average price was 46*s.* 7*d.* per quarter. In the corresponding period of 1861 it was 55*s.* 1*d.*; in that of last year it was 60*s.* 1*d.* Beef was near its usual price; the average lowest and highest prices of mutton at Leadenhall and Newgate were 5*d.* and 7*d.* per lb. by the carcase. Potatoes were cheaper than they have recently been at this season, the best having been sold at the Waterside Market, Southwark, at about 125*s.* per ton.

Mr. Glaisher writes, that with the exception of eleven days in March the weather at Greenwich was warm, and in the seventy-nine days the daily excess of temperature was on an average nearly five degrees. The period comprising December, January, and February was, as compared with corresponding periods, amongst the warmest on record. For those three months together there are only three instances of a higher mean temperature since 1771.

The mean temperature of last quarter was 42·6°; and as far as records that can be trusted extend, it has been exceeded in the same period of the year in only two instances.

In regard to the four months ending 31st March, the mean temperature may be considered to have been as high as any that has ever been experienced in a season extending through the same months.

In the quarter the humidity of the air was below the average in January and March, above it in February. The rainfall was rather above the average in January, below it in the subsequent two months. In the southern parts of England there was little rain at any time in the quarter; north of 53° latitude there was a great deal in January, but generally in February and March the weather was dry.

The returns of pauperism are expected to be heaviest in the first quarter of the year; but those obtained for that portion of the present year show an over-growth, which much exceeds the product of an ordinary winter. In-door paupers were more last quarter than in the corresponding

1863	118,490	1000	1095	999	942	964

season of 1861, while they were nearly the same as in that of 1862; but the poor relieved out-door were far more numerous than in either, as the following statement of the average numbers relieved every Saturday will prove:—

	In-door.	Out-door.
First quarter 1861 -	131,138	757,950
„ 1862 -	143,772	804,268
„ 1863 -	142,257	943,324

Deaths; and State of the Public Health.—A winter remarkably "mild" has also been remarkably unhealthy. The deaths in England in the three months that ended 31st March were 128,096, against 122,019 in the same period of last year, which supplies an example of average health in winter, and may be taken as a means of comparison. It will be an approximation to the truth, to state that people died in the quarter at the rate of 20,000 in a year, whose lives would have been saved if epidemics or atmospheric causes of a nature unfavourable to health had not been in greater force than usual. The rate of mortality was 2·538 per cent., the average being 2·498.

The mortality of small towns and rural districts was 2·323 per cent. (against an average of 2·28). That of the chief towns was 2·706 per cent. (against an average of 2·68). The country appears to have suffered from the effects of the winter more than the town.

In London a sudden interruption of early spring weather, by a fall of the temperature, occurred in March, and was followed by an extraordinary increase of mortality, which continued many weeks after the apparent cause had ceased, and warm weather had resumed its sway.

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,032 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

That the increase of deaths at that time was not confined to London appears in the report from Southampton, where they were in the latter half of March more than twice the number that had occurred in the earlier half of the month. But the deaths of the quarter in that sub-district were below the average, in consequence, as the Registrar supposed, of "the mildness of the weather and the absence of epidemics." While a decrease of mortality is at one place attributed to "mildness," an increase of mortality is attributed to the same cause at another; and perhaps the true reason is assigned in both cases. It may be presumed, if the common experience of mankind does not teach, that the fine weather which is grateful to the senses is also directly beneficial to the health. If a high temperature by day is succeeded by chill at night, or "mildness" of the season, as the rule, is chequered by quick transitions; and, particularly, if from badness of drains, or want of rain to scour them, sewage accumulates, and in the warm air gaseous products are evolved, the season will be unhealthy, and many will suffer that doom on which the poet moralised, when he had sung winter dissolved by the welcome change of spring. A fever epidemic prevailed at Witney in Oxfordshire, which the Registrar and the medical officer agreed in attributing to the mild weather and the bad sanitary condition of the district. There was "gastric fever" at Butler's Cross, and very much of it at North Lee, both places in Buckinghamshire, and reported to be deficient in drainage or other arrangements. In Suffolk, the mortality had increased at Fornham, and "low typhoid fever" had caused a great deal of illness at Wenhaston, in both cases on account of "the mildness of the season," and also in the latter case from personal uncleanliness and want of cottage accommodation. At Dulverton in Somersetshire, "a great number of old people (says the Registrar) have succumbed during the late mild winter." The Registrar of Worcester, North sub-district, states that the mortality had been high amongst young and old; that measles followed by pneumonia had been fatal to the former, and a remarkably mild winter to the latter. But the Registrar of Helmsley, in the North Riding of Yorkshire, considers that a reduction of the mortality which occurred in his district, notwithstanding the prevalence of a virulent form of small-pox, was caused by the mildness of the season. It appears, however, that fine weather was not universal; for at Bolton it was "cold, damp, and changeable;" at Ashton-under-Lyne also "cold aud damp;" and at Cheadle in Staffordshire, "damp and foggy."

In the South-eastern portion of England the death-rate was lowest; in the North-western Counties, Cheshire and Lancashire, it was highest, a distinction which the seat of the cotton manufacture has earned alike in its prosperity and adversity. But in comparing the returns of deaths in the Eleven Divisions, attention is immediately drawn to the fact, that in all the divisions, with one exception, the deaths were more numerous last quarter than in the March quarter of 1862; and the single exception is found in that division where the staple industry on which half a million of persons are dependent is overthrown, and for a twelvemonth four fifths of that number have subsisted, unless the pittance has been aided by previous earnings or sale of household stock, on less than 4*d*. a day per head. Or if the deaths in last quarter are compared with the mean number of two corresponding quarters in 1861–62, the increase for England was nearly six per cent.; for London and the North Midland Counties 2·5 per cent.; for the South-eastern and South Midland Counties, and Yorkshire, 7 per cent.; for the Eastern, South-western, and West Midland Counties about 12 per cent., while for the North-western division the increase (0·3 per cent.) is hardly appreciable, and for Lancashire, which constitutes the most important part of it, is found an actual decrease of the mortality. If the sixteen most important cotton districts of Lancashire are taken, there was an increase of deaths in five, a decrease in the

remaining eleven. The increase was greatest in Chorlton (16 per cent.) and Oldham (21 per cent.) The decrease was great in Wigan, Warrington, Leigh, and Bury, in which places it was 17 and 18 per cent., greatest in Preston and Burnley, where it was 20 and 24 per cent. This is a brief statement of the facts, whatever may be the solution of the problem which it suggests.

It may be observed: 1. While England enjoyed at least its average amount of health in the two winter quarters of 1861–62, Lancashire was at those times more unhealthy than usual, and in the common fluctuations of epidemics and other disease more or less improvement of the public health was to be expected. 2. The emigration returns discover a remarkable increase of English emigrants since March 1862; for whereas the number in each quarter of 1861 and till April 1862, was from 5000 to 9000, since that period it has been from 10,000 to 14,000. The Registrar of Witton (Blackburn) mentions that a great number of families had removed out of his sub-district from want of employment; and it is probable that the populations of other parts have been diminished, enough to affect the local registers, by similar movements to places in England and beyond the seas, where that market for labour may be found which has failed the industrious at their own homes. 3. It will be gratefully admitted that the legal provision for the distressed, and the spontaneous liberality of their countrymen, have hitherto sufficed to maintain the people in health. But if the supply has been enough, it has not been more than enough, and its inevitable tendency is to a fall; and though it could be sustained for an indefinite time, it does not follow that the health of a community living in forced inaction could also be indefinitely prolonged, while that which has been called "the real life" of the people must be ebbing fast. 4. The Registrar of Wigan reports, that not a single death had arisen in his district from the distress; and as other local officers are silent on the deaths of operatives from want, it must be assumed that happily they had none to report. In London, deaths attributed directly to privation average about 30 in a year; but in the families of cotton operatives cases of extremity will be more rare at the present time than when the country is less awakened to their wants. At Runcorn, the wife of "a general labourer," who had been little employed for a long time, was stated to have died from "chronic bronchitis and starvation;" and another woman, also the wife of "a general labourer," died from "consumption accelerated by grief and starvation." Both those deaths occurred in January. At North Meols (Ormskirk), a man and his wife died of typhoid fever, which they brought with them from Liverpool. The Registrar "believes that they died from destitution; nobody would "go near them while the woman lived, except a female, who only went in "three times."

The following interesting report has been received from the Registrar of the sub-district of Preston:—

Births 889; Deaths 531. The deaths are 179 less than in the corresponding quarter of the last year, and 135 less than the average for the last five corresponding quarters. The following diseases have been among the most fatal: bronchitis 82; phthisis 71; pneumonia 22; typhus 10; typhoid fever 10; diphtheria 8. 240 children died at and under five years of age. The births are 43 less than in the corresponding quarter of the last year, and 8 more than the average of the last five corresponding quarters. The mortality of this sub-district has been very low this quarter, as compared with the corresponding quarter of last year. The decrease has shown itself during each month, as will be seen from the following statement. For the weeks ending January 3d, February 21st, and March 7th, the following deaths were respectively registered: 37, 47, 37; in the corresponding weeks of the last year I registered 66, 75, and 65. The cotton trade is in a much worse condition than it was two months ago, and I fear that there is a still more gloomy prospect before us. The number of persons out of employment now is greater than it has been since the distress commenced. On the 13th January there were 12,303 persons out of work and 33 mills closed; but on the 14th March the numbers were 14,990 persons unemployed and 40 mills closed. The largest spinning and manufacturing firm, which employs upwards of 3,000 persons, reduced the time of working

from three days to two days per week on Monday, March 9th, in consequence of the large and accumulating stock of cloth which they have on hand. The most effectual method of mitigating the distress and preventing a further reduction in the hours of labour would be for those who have the means to purchase cotton cloth, so as to reduce the stocks now on hand. It has been stated that if this were done it would only entail an extra cost of about twenty shillings per year for each family. If no purchases are made the mills must of necessity be closed, and the whole of our factory operatives thrown out of work. It is to be fervently hoped that an adequate supply of good cotton may soon be obtained, so that our poor distressed operatives may be again fully employed, and then they will be enabled to eat their food with a sweeter relish because it has been earned by their own labour.

Second Quarter.—April, May, June, 1863.

In the last Quarterly Report it was stated that in the period to which it referred the birth-rate had been unusually well maintained. That rate was still higher last quarter ; and in all the quarters of all the ten years, 1853–62, only two instances occurred in which it was as high or higher. This fact may be remarked in connexion with the generally healthy state of the population during last year. After a season of depression which extended over two years the marriage-rate rallied in the first quarter of the current year, and rose decidedly above the average in the subsequent quarter. The improvement indicates increased confidence in the minds of the people, in respect to their ability to earn a sufficient and comfortable subsistence. But in taking a general survey of the returns, that which chiefly claims notice is the fact that the mortality, which was high in the first quarter of the year, continued high in the quarter that ended on June 30th.

Marriages.—The number of persons married in the June quarter was 88,292 ; they were married at an annual rate of 1·73 to a hundred persons in the population. The average rate for the same quarter is 1·69 per cent. In the two corresponding quarters of 1861–2 the rates were 1·68 and 1·61. A certain number of the prospective alliances of those two years, deferred in expectation of better times, would doubtless attain their consummation in the present year.

The number of marriages was 44,146, against 42,012 and 40,853 in the corresponding quarters respectively of 1861–2. In London and in all the groups of counties into which England is divided in the tabular arrangement, the marriages were more numerous than they had previously been in the June quarter of 1862. In London they rose from 7209 to 7803 ; in the South-eastern Counties from 3328 to 3663 ; in the West Midland from 4950 to 5390 ; in the North Midland from 2653 to 2817 ; in the North-western, which embrace Cheshire and Lancashire, from 6401 to 7006; in Yorkshire from 4159 to 4536 ; in Monmouthshire and Wales from 2494 to 2810. Of forty English Counties only five appear in which there was a decrease ; these were Kent, Northamptonshire, Devonshire, Cornwall, and Shropshire. Many of the districts of which the counties consist are unimportant in numbers ; and not a few, more or less important, might be cited, which exhibit a decrease ; but increase is the rule, and as such tends to show that the view which the marriageable part of the community were enabled to take of their position was on the whole satisfactory to themselves.

Liverpool and its neighbouring districts Birkenhead and West Derby mainly contributed to that improvement which is manifested in the marriage registers of the North-western Division. In those three districts the marriages in the June quarter of 1862 were 1533 ; in that of 1863 they were 1755. In Manchester and Salford together they were 1197 and 1342 ; in Ashton 220 and 258 ; in Blackburn 200 and 270 ; in Preston 213 and 238. The district of Stockport exhibits a decrease ; and there are others, in the seat of the cotton manufacture, which, if they show little decrease in the marriages, were not able to furnish an increase. In such localities, as in others, it is probable that occupation was partially

restored and distress alleviated; but the movement of young men and women in quest of work was sufficient to depress the marriage returns more than it did in other districts.

Increase of Population.—The births exceeded the deaths by 71,219. Therefore each day in the three months gave on an average a natural increase of 783 to the population. Immigration and emigration modify the result.

It was stated in last Report that the emigration of the March quarter, consisting of 37,806 persons of the English, Scotch, Irish, and other nations, was greater than it had been in the same season since 1854. The Return of the Commissioners for last quarter shows that emigration had attained a magnitude that can hardly fail to surprise when the circumstances of the Western world, by which it appears to have been chiefly evoked, are taken into consideration. The number of emigrants rose to 83,290, which is more than in any June quarter since that of 1857. In the same period of 1861 it was about 38,000; in that of last year 47,000. The Australian colonies supply an increasing attraction; British North America also draws a growing number; but of the 83,290 emigrants, 56,436 (of whom at least 40,000 were Irish) chose the United States as their destination.

The English people contributed about a fourth part of the emigration to all parts.

Prices, the Weather, and Pauperism.—The lowest and highest prices of beef at Leadenhall and Newgate were $4\frac{1}{4}d.$ and $6\frac{1}{4}d.$ per lb. sold by the carcase. In the same period of last year they were $4d.$ and $6d.$ During the last twelve months the average price of the best quality has not varied. The price of mutton fell. In the June quarter of 1862 the worst and best qualities were $5d.$ and $7d.$ per lb.; and they were near those prices in the succeeding nine months, till last quarter, when they were $4\frac{3}{4}d.$ and $6\frac{3}{4}d.$ The average price of wheat fell to $46s.$ $2d.$ per quarter; that of the best potatoes to $120s.$ per ton against $190s.$ in the same quarter of last year. Beef furnishes the only exception to the comparative cheapness of the principal articles of food.

Mr. Glaisher writes that the period of five months that began with December and ended on 30th April was as warm as any corresponding period in meteorological annals. The first half of the last quarter, viz., from the beginning of April to the middle of May, with the exception of a few days, had a mean temperature which was on an average two degress in excess daily. After the 17th May, for a period of nine days, it was no less than 6° under the average. Again the temperature rose, and was 3·25° in excess till 5th June, from which date till the end of the quarter the air was cold.

The mean temperature of the air in April was 49°; that of May 52°; and that of June 58°. The mean temperature of April was higher than that of the same month in any year since 1844. Days and nights in April were warm; nights in May and days in June were cold.

Rain fell to the amount of 5·6 in., of which 3·9 in. fell in June. In the preceding two months of the quarter the rain-fall was scanty.

This account of the weather is derived from the observations at Greenwich.

The pauperism of the June quarter declined, as is usual, on that of the March quarter; but as regards the recipients of out-door relief it was much greater than in the June quarter of 1862. The average numbers of poor persons relieved on the last day of each week, in three corresponding quarters, were as follows:—

	In-door.	Out-door.
June quarter 1861	117,801	713,786
,, 1862	127,861	782,113
,, 1863	127,063	873,503

Deaths, and State of the Public Health.—After a period of two years in which the public health was better than usual, the mortality rose in the last three months of 1862, was high in the first three months (the winter quarter) of the current year, and continued above the average in the quarter for which the returns are now made. In this last period the death-rate was 2·308 per cent. per annum, whilst the average was 2·19. With the present exception, a spring quarter has not occurred since the year 1853 in which the rate of mortality was as high as 2·3.

Both town and country testify to an increase of deaths in their respective populations; for the rate in the chief towns was 2·470 (against an average of 2·34), and that which prevailed in small towns and country parts was 2·100 (against 2·03). Summer-like weather in the early year, and cold days or nights striking a sudden chill into the heart of it, produce effects from which neither city nor hamlet is exempt.

That vast town population that resides within "the bills of mortality" suffered in common with the provincial populations, and in its due proportion; for though those complaints that are more directly traceable to meteorological causes, namely, bronchitis and pneumonia, were little if in any degree more fatal in the metropolis than usual, both small-pox and scarlatina were very prevalent, and caused numerous deaths. Small-pox carried off 788 persons in London, or nearly 9 daily; scarlatina and diphtheria 1230. Though the former disease destroyed fewer lives than the latter, it was more powerful in inspiring the public mind with a salutary dread. It should not be overlooked that prophylactic measures are available against scarlatina as well as small-pox, and both maladies are subject to modification.

Small-pox was not confined to London; its presence, which assumed in some instances a character of virulence, is announced by Registrars in many and distant parts of the country. The following are the chief districts, parishes, or townships where the attack was of sufficient importance to procure a notice in the reports of the local officers:—In Surrey: Croydon and Godstone. In Kent: Maidstone and Rochester. In Berkshire: Reading and Kintbury. In Bedfordshire: Wing (Leighton Buzzard). In Essex: West Ham, Orsett, Rochford, Manningtree, Colchester, and Sible Hedingham. In Suffolk: Cavendish. In Cornwall: Bodmin, Truro, Redruth, and Penzance. In Warwickshire: Kilsby. In Lincolnshire: Grantham, Market Rasen, and Misterton. In Derbyshire: Derby and Glossop. In Cheshire: Stockport. In Lancashire: West Derby, Wigan, Didsbury, Chorlton-upon-Medlock, Manchester (where it was very prevalent), Ashton, and Oldham. In Yorkshire: Barnoldswick, Ripon, Harrogate, Wetherby, Yeadon, Elland (Halifax), Shipley (Bradford), Bramley, Leeds, Dewsbury, Barnsley, Ecclesall Bierlow, Sheffield, Bramham (Tadcaster), York, Sculcoates, Hull, Whitby, and Northallerton. In the Northern Counties: Stockton, Yarm, Bishop Auckland, and Chester-le-Street. Fear of the disease, minatory notices issued by Guardians, or the infection of example, have given a useful stimulus to vaccination in many places where it had been opposed by prejudice or had sunk into neglect.

Not only small-pox but also measles and scarlatina attacked the industrial populations both in Lancashire and Yorkshire. Of 287 deaths in the St. Helen's sub-district of Prescot 68 were from measles; and out of 371 in Wigan 72 were from the same disease. In West Leigh a fourth part of the total number of deaths was from measles, which was also very fatal in Bolton. In the sub-district of Oldham-below-Town out of 312 deaths 15 were from small-pox, and 57 from scarlatina. In the North sub-district of Sheffield 23 cases of small-pox and 20 of scarlatina were fatal; and in Brightside (Sheffield) 27 cases of small-pox, 25 of scarlatina, and 20 of measles were attended with the same result.

The mortality of London in the quarter was 2·40 per cent., that of the North-western Division 2·57, that of Yorkshire 2·59. Cheshire and

Lancashire constitute the North-western Division; and the death-rate in the latter county apart from the former, was 2·59. Liverpool, Manchester, and other large towns have long invested this county with an unfavourable distinction, which it is hoped the important measure now passed by parliament for enabling the distressed unions to borrow money for works of public utility will be successfully employed to remove. In the present day the rate of mortality in Lancashire furnishes a striking contrast to that of the South-eastern Counties, which was 1·97 last quarter. To reduce, if not to annihilate the difference, is not an impracticable task.

The deaths in London rose from 15,230 and 15,654 in the June quarter of 1861–2 to 17,263 last quarter. Those in the North-western Counties rose from 17,576 and 18,024 to 19,473; those in Yorkshire from 11,600 and 11,821 to 13,339. The increase in Lancashire and Cheshire in last quarter on the mean mortality of the two previous seasons was 9 per cent., and less than in London and Yorkshire, where it was 13 per cent. Taking particular districts of the cotton manufacture, there was an increase in Oldham; in Manchester and Warrington of 20 per cent.; in Chorlton and Wigan of 25 and 34 per cent. Measles and other epidemics, as has been shown above, were spreading through those parts. On the other hand there was a decrease in Ashton, Preston, and Chorley amounting in the last two districts to 20 per cent. or more. It is probable that fewer deaths have been registered in many districts in consequence of the emigration or removal of the inhabitants, for doubtless many villages besides Belmont, which the Registrar writes is "almost uninhabited, owing to the badness of trade," complain of empty houses; but in reviewing the whole facts of the present Return, they will be found to support the conclusion which former Reports tended to establish, that sickness has not been aggravated nor the mortality increased by the distress which has prevailed, and which happily to a certain extent has now been subdued. It must be regarded as a providential interposition in favour of the under-fed and half-clad workmen and their families, that the period embracing December and four succeeding months was, in the words of the Meteorological Report, distinguished by a temperature higher than in any corresponding period since 1771.

The leading facts in the financial history * of the distress may be stated in a few words:—The number of persons dependent on the Parochial rates and Relief funds was 500,000 before Christmas 1862, when the maximum was attained; at the end of June it was reduced to 256,230. Nearly half the burden is at the present time removed. The expenditure from both sources in December was 289,225*l.* It was reduced in June to 102,241*l.* The loss of factory wages per week, at the end of January 1863, was 172,018*l.*; at the end of June, 132,553*l.* The decrease in weekly expenditure from the Rates and Relief funds (the last week in December 1862 being compared with the last week in June 1863) has been in six months 20,000*l.* The total expenditure in twelve months from 30th June 1862 to the same period in 1863 was about 1,676,413*l.*, of which amount 1,054,413*l.* † was derived from Relief funds, and 622,000*l.*, expended on the out-door indigent only, from Parochial rates.

The improvement in the cotton districts, by which forty-seven local committees have been enabled to suspend operations, has arisen from various causes: the emigration or removal of operatives, the increase of out-door work, the partial revival of industry. The Public Works Act, if adopted and carried into execution with earnestness and goodwill, is expected to provide the wages of labour to a fifth or sixth part of the population who without its aid would be in want. But, notwithstanding

---

* See Report of the Central Executive Committee (Manchester, July 20th, 1863).

† A portion of this sum appears to have been expended in May and June 1862.

present encouragement, the Central Executive Committee takes a desponding view of the coming winter. Those external conditions of the cotton trade from which the ruin of the manufacture sprung remain unchanged, and there is little prospect of that cheapness of material on which former prosperity was based. Present alleviations of the distress will, some of them, cease when summer and autumn have passed. Private savings are spent, credit exhausted, relief funds diminished. Therefore it is not unreasonable to anticipate that though the distress of the approaching winter may visit fewer hearths, its severity, where it falls, may be greater, because the means of relieving it may be less.

The Registrar of Preston writes as follows :—

Sub-district of Preston.—Births 917 ; Deaths 483. The deaths are 112 less than in the corresponding quarter of the last year, and 123 less than the average for the last five corresponding quarters. I have again the satisfaction of reporting a great decrease in the mortality as compared with the corresponding quarter of last year, and which is the more gratifying because we are still suffering so severely from want of employment. In each of the first eight weeks and the tenth the number of deaths registered was below that of the same period of last year ; but in the ninth, eleventh, twelfth, and thirteenth there was an increase. In my report for the quarter ending December 1861, I stated that no death had occurred from small-pox in this sub-district ; since then I have registered 3,427 deaths, of which 1,687 were children of five years old and under, but not a single death has resulted from that disease, notwithstanding there have been a few cases of it, two of which brought the infection from Liverpool. This favourable result may be principally attributed to the great care manifested by the medical profession in carrying out the Vaccination Act. Since April 4th a gradual improvement has taken place in the cotton trade, as will be seen from the following statement, and a more cheerful feeling prevails respecting the future.

	June 20th.	April 4th.
Persons employed 6 days -	11,008	5,824
„ „ 5 „ -	767	752
„ „ 4 „ -	474	2,000
„ „ 3 „ -	169	784
„ „ 2 „ -	3,199	3,109
„ totally unemployed -	11,807	14,955
Mills closed - - - -	25	38
Employed in ordinary times -	27,424	

In the week ending June 20th 19,657 persons were relieved by the relief committee, and 11,647 by the guardians, being a decrease, as compared with the previous week, of 3,108 persons.

Third Quarter.—July, August, September, 1863.

The marriage-rate was above the average during the first nine months of the last year for which we have returns ; and it is well known that they afford a good indication of the opinions which the people themselves have of their prospects in life. The births were more numerous than they had ever been in the summer quarter before ; and the proportion they bore to the population in which they occurred was higher than usual. But while the aspect of the returns is favourable as regards marriages and births, a tale of deaths, which is heavier than that of any summer quarter since the year of epidemic cholera 1854, shows that the public health was far from being in a satisfactory state. The death-rate was considerably higher than it had been in any of the corresponding quarters that have intervened since 1854. Epidemic diseases spread with destructive force amongst the young ; and apparently the season was less salubrious than it usually is to older persons.

Marriages.—83,864 persons were married in the quarter that ended on September 30th, 1863. The weddings were 41,932, and exceed by 1332 the weddings in the summer quarter of 1862, and by 2048 the weddings in the summer preceding. The marriage-rate was 1·616 per cent., and this is above the average of ten preceding quarters. Thus the marriage meter indicates by its rise a steady improvement in the

condition and prospects of the great body of the nation. London takes the lead, and is followed by all its surrounding divisions; in the interval between 1861 and 1863 the summer marriages rose from 7322 to 8029 in the metropolis; from 3232 to 3508 in Kent and the other South-eastern counties. A notable increase also appears in the returns of the counties of Hertford, Oxford, Bedford, and Cambridge; in Suffolk and Norfolk; while marriage decreased in Wilts, Devon, and Somerset; but increased in Gloucester, Bristol, Salop, Stafford, and Warwick, which are pervaded in different degrees by prosperous coal and iron works. Leicester, Lincoln, and Derby show an increase; Nottingham indicates some depression.

The marriages of Cheshire and Lancashire fell from 7086 in the summer quarter of 1861 to 6380 in the corresponding quarter of 1862, but in the summer quarter of the year 1863 rose again to 7001, and thus gave the signal of reaction. Yorkshire sympathized with Lancashire,—especially in Huddersfield, Halifax, Bradford, and Hull,—but the reaction in this great county was more complete; and the people of Leeds and Sheffield married in greater numbers than they did in either of the two preceding summer quarters. The marriages increased steadily in the Northern Counties; and the Principality of Wales, either animated by loyalty, or by the heat of the iron trade, surpassed the Metropolis in the rise of its marriage-rate, which exceeded by 12 per cent. the summer rate of Wales in 1861.

Births.—The annual birth-rate in the summer quarter (July, August, September) was 3·34 per cent. against an average of 3·29. The total number of births was 173,439; in the same quarter of 1853 the number was 147,602. That part of the English nation from which the natural supply of population is drawn has so far increased in ten years as to produce more children by 25,837 than it did in a similar period in 1853.

The births registered in London were 24,589. The four Northern Counties, with their population of less than 1,200,000 as returned at last Census, registered as many births (11,199) as Monmouthshire and Wales with a population exceeding 1,300,000. In all the Eleven Divisions, with only a few considerable exceptions, the births were more numerous than they had been in either of the two previous corresponding quarters. There was a decrease on the mean of those quarters in the Eastern Counties amounting to nearly 3 per cent.; in the North Midland to 2 per cent.; and in the North-western (Cheshire and Lancashire) amounting to 3 per cent.

Increase of Population.—As the births were 173,439 and the deaths 112,504, the natural increase of the population was 60,935. The increase was at the rate of 662 daily.

The number of emigrants who left ports in the United Kingdom at which there are Government Emigration Officers was 58,320 in the quarter, of whom 20,008 were of English origin. 36,496 were bound for the United States; 6538 for the North American Colonies; 14,075 for the Australian Colonies; and 1211 for other places. The emigration was greater than it had been in any September quarter since 1854, and nearly three times as great as it was in that of 1861. There was an increase in the emigration to Canada and Australia, but it was insignificant as compared with the extraordinary result which the temptation of employment with high wages in the United States has produced by stimulating the movement, chiefly of the Irish people, to that country. But the temptation does not appear to operate on the Scottish mind, for it deserves to be noted that while 2059 emigrants sailed from ports in Scotland for British North America, and 1224 for the Australian Colonies, none went to the United States. Nor was there any emigration to the country last mentioned from Scotch ports in the September quarter of

1862 ; and there was almost none in that of 1861. It has declined since 1851, when in the corresponding three months it embraced 2854 persons.

Prices, Pauperism, and the Weather.—Wheat and potatoes were both cheap ; the latter esculent ranged for the best quality from 70*s.* to 105*s.* per ton at the Waterside Market, Southwark, a price which is lower than what has been obtained at the same place at any previous time since the September quarter of 1859. The average price of wheat was 45*s.* 7*d.* per quarter, which is less than at any other time since March 1860 ; it has been falling during the last eighteen months. The average price of the better and worse qualities of beef sold by the carcase in the City markets was $5\frac{3}{8}$*d.* per lb. ; that of mutton $5\frac{3}{4}$*d.*

The following figures show the average number of paupers relieved on the last day of each week in the last three summer quarters :—

	In-door.	Out-door.
September quarter 1861 -	112,930 -	693,631
„ 1862 -	119,600 -	789,917
„ 1863 -	120,343 -	817,238

This statement exhibits an increase in the present year, which arises from the circumstance that many recipients of relief in the distressed manufacturing districts have been transferred from the Local Committees to Boards of Guardians, and have thus prevented that decrease in the above returns of pauperism which the improvement in the condition of those districts would otherwise have effected. The number of poor persons relieved out-door by the Guardians in the cotton districts in the three months ending 30th September 1863 was 398,988. In administering relief to 148,228 of that number the Boards were aided by the Local Committees.

The weather in the quarter, as observed and described by Mr. Glaisher at Greenwich, was characterised by alternations of heat and cold till the middle of the period, and by cold attended with much wet during the last six weeks, circumstances which could hardly fail injuriously to affect the public health. From the beginning till the middle of July, the mean temperature of the air exceeded the average by two degrees ; thereafter to the end of the month it was below the average nearly four degrees. Heat followed in the first fortnight of August, three degrees and a half in excess. For the remaining portion of the three months there was an almost daily defect of about two degrees in the temperature. The mean temperature of the whole period was 58·8°, which is about one degree below the average. The amount of rain measured was six inches, which is nearly two inches less than the average ; but half of it fell in September, which was a moist month, when the two months which preceded it had been dry. Both days and nights in the earlier half of August were warm, but in September both were cold. Though the weather has been less favourable to health than it was in previous summers, the Report of the Registrar of Preston may be quoted here, for it is applicable to other districts besides his own :—"The bountiful harvest "which we have had, and the abundant crop of potatoes, will be an "invaluable blessing, and will greatly assist in mitigating the sufferings "of the working classes during the winter."

Deaths ; and State of Public Health.—The total number of deaths in the last quarter was 112,504, against 101,232 and 92,381 respectively in the two previous summer quarters. In the same period of 1860 the number was only 86,312, and if last summer had been as healthy, it may be stated in round numbers that at least 23,000 persons would have been living when autumn came whose names were enrolled in the registers.

The increase of deaths on the mean of two previous corresponding quarters (1861–2) was equal to about 13 per cent. in London, 15 per cent. in the South-eastern Counties, 22 in the South Midland, 14 in the

Eastern, 19 in the South-western, 19 in the West Midland, 17 in the North Midland, 15 in the North-western (Cheshire and Lancashire), 21 in Yorkshire, 18 in the Northern Counties, and 7 in Monmouthshire and Wales. Hence it appears that the increase was least in Monmouthshire and Wales, greatest in the South Midland Counties and Yorkshire; and that in the Metropolis, in the Eastern and South eastern Counties, and in the districts of the cotton manufacture, it was from 13 to 15 per cent. The unfavourable influences that were at work pervaded the country generally, and Lancashire did not suffer more than most parts, but less than some. When the Central Committee for the relief of the distressed districts state in their Report (19th October), written some weeks after the complaints that prevail chiefly in the warm season have subsided, that "the health of the population is generally in a satisfactory condition," probably nothing more is implied than that the families of the operatives are as healthy as they usually are in October, though they may not yet have attained that measure of health which it is hoped the sanitary works that are to be begun or are already in progress will confer upon them.

Scarlatina and diarrhœa, widely diffused over the country, were the chief immediate causes from which the increase of mortality sprung. The deaths rose to 2·169 per cent. per annum, against the average summer rate of 1·98. In the Eastern and North Midland Counties the death-rate was rather below the average of England; in London it rose to 2·33; in Cheshire and Lancashire it was 2·43; in Yorkshire 2·45. That great division which contains the districts of the cotton manufacture has always asserted a bad preeminence in the tables of mortality; but notwithstanding the distress that still prevails, and the greater distress it has suffered, it will be seen that in the present returns it may be compared with Yorkshire without disadvantage. Its density of population is much greater than that of any other division, with the exception of London, and is more than double that of Yorkshire. Lately a certain number of the working population has removed, in what amount is unknown, and Yorkshire has doubtless gained part of that which Lancashire has lost; but this circumstance can hardly affect the comparison in any material degree.

The death-rate in the town districts of England was 2·410 per cent., against an average of 2·24. The mortality of the country districts was, as is usual, considerably less; but it was also much in excess of the summer average, for it rose to 1·862, against 1·69. It is obvious that cities are not the only haunts of those diseases that are propagated by foul air and bad water, and in homes of penury; nor are young rustics proof against the weather. In a thousand instances the water which town populations command within their houses, the countryman in the village or on the wild can only obtain with uncertainty and toil; his rations are meagre; his walls damp; the refuse-heaps are near his door, "for as a rule no rubbish is removed, but waits patiently the action of "mere natural chemistry;"* and shut up many hours of the night with his family he is deprived even of that which is supposed his inalienable birthright, the pure air, which invests his dwelling and seeks on all sides, but in vain, to be admitted.

A short list of districts, parishes, townships, or other places which have been specially noted by the Registrars as localities where scarlatina has sensibly increased the mortality will suffice to show how universally that disease has been diffused over the country. Besides many other parts, it prevailed in Godstone, Maidstone, Deal, Walmer, Havant (where it caused 20 deaths out of 48), Cowes, Ryde, Basingstoke, Uxbridge, Brentford, Ware, Standon, Northampton, Weldon, Peterborough, Toddington (where

* Thomas Carlyle: Life of Sterling.

out of 40 deaths about 30 were from scarlatina), Leighton Buzzard, Stratford in Essex, Grays, Great Burstead, Great Waltham, Colchester, Kelvedon, Coggeshall, Hedingham, Wickhambrook, Sudbury, Lavenham, Hadleigh, Stanton, Poole, Bere Regis, Newton Abbot (half of the 78 deaths there were from scarlatina), Dartmouth, Plymouth, Looe, Mevagissey (where the deaths were 49 out of 81), Truro, Falmouth, Helston, Penzance, Stogursey, Bishops Lydeard, Stowey, Keynsham, Bedminster, Bristol, Clifton, Gloucester, Cainham, Bridgnorth, Gresley, Tamworth, Sedgley, Worcester, Hinckley, Barrow-upon-Soar, Leicester, Uppingham, Bourn, Pinchbeck, Boston, Birkenhead (49 deaths out of 104 in Wallasey, a sub-district of Birkenhead, were from scarlatina), Warrington (where there were 143 out of 319), Pilkington, Chorlton-upon-Medlock, Hulme (where "the Black Brook" contaminates the air and spreads scarlatina and diarrhœa on its banks), Salford, Manchester, Preston, Huddersfield, Hunslet, Leeds, Ecclesall Bierlow, Sheffield, Doncaster, York, Sculcoates, Hull, Eston, Normanby, Durham, Sunderland, Carlisle, Abergavenny, Bedwelty, and Newport.

The Central Executive Committee for Relief of the distressed Districts has issued a Manual to the Local Committees, in which it recommends the establishment of temporary hospitals in places where infectious disease

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Districts of London; Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge: *West and East Maidstone Sub-districts* (Maidstone); Canterbury; *Minster Sub-district* (Sheppey); Thanet, Dover, Hastings, Brighton; *Shoreham Sub-district* (Steyning); Portsea Island, Alverstoke, Southampton; *Winchester Sub-district* (Winchester); Reading, Brentford, Edmonton; *St. Clement Sub district* (Headington); Oxford, Northampton; *Peterborough Sub-district* (Peterborough); *Bedford and Kempston, and Bedford and Cardington Sub-districts* (Bedford); *Luton Sub-district* (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salishury; *Weymouth Sub-district* (Weymouth); Exeter; *Torquay Sub district* (Newton Abbott); Plymouth, East Stonehouse, Stoke Damerel, Truro, Redruth; *St. Mary Magdalen and St James Sub-districts* (Taunton); *Bridgwater Sub-district* (Bridgwater); Bath; *Bedminster Sub-district* (Bedminster); Bristol, Clifton; *St. Nicholas and St. John Baptist Sub-districts* (Gloucester); Cheltenham; *Hereford City Sub-district* (Hereford); Madeley, Shrewsbury; *Stafford Sub district* (Stafford); *Newcastle-under-Lyme Sub-district* (Newcastle-under-Lyme); Wolstanton, Stoke-upon-Trent; *Burton-on-Trent Sub-district* (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; *Kidderminster and Lower Mitton Sub-districts* (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; *Loughborough Sub-district* (Loughborough); Leicester; *Boston Sub-district* (Boston); *Lincoln Home Sub-district* (Lincoln); *Great Grimsby Sub district* (Caistor); Radford, Nottingham; *Newark Sub district* (Newark); Derby, Hayfield, Stockport; *East and West Macclesfield and Sutton Sub-districts* (Macclesfield); *Runcorn Sub-district* (Runcorn); *Congleton Sub-district* (Congleton); *Chester Castle and Chester Cathedral Sub districts* (Great Boughton); Birkenhead, Liverpool, West Derby, Prescot, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; *Chorley Sub district* (Chorley); Preston; *Lancaster Sub district* (Lancaster); Keighley, Todmorden, Huddersfield, Halifax, Bradford, Hunslet, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; *Doncaster Sub-district* (Doncaster); *Bootham, Micklegate, and Walmgate Sub-districts* (York), Sculcoates, Hull; *Scarborough Sub district* (Scarborough); *Darlington Sub-district* (Darlington); Stockton, Hartlepool; *St. Oswald and St. Nicholas Sub districts* (Durham); Houghton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon Tyne, Tynemouth; *St Cuthbert and St. Mary Sub-districts* (Carlisle); *Whitehaven Sub-district* (Whitehaven); *Kendal Sub-district* (Kendal); *Newport Sub district* (Newport); *Cardiff Sub-district* (Cardiff); Merthyr Tydfil; *Llangafelach and Swansea Sub-districts* (Swansea); *Llanelly Sub-district* (Llanelly); *Pembroke Sub-district* (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 91 days; each of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also for the difference between 365 and 365·25 days, and 366 and 365·25 days in leap year.

may have become general, as the best means of preventing the spread of the infection in families. It strongly urges house-to-house visitation, and other valuable sanitary precautions on their attention.

The deaths in Cumberland were 938 and 924 in the September quarter of 1861–2; they were in the last quarter 1159, and exhibited an increase of 24 per cent. In the district of Carlisle they were in those three summer quarters 232, 209, 287; in Cockermouth 195, 201, 218; in Whitehaven 169, 192, and 297. In the Cockermouth district the mortality

was 21 deaths to a thousand of the population ; in Carlisle it rose to 25 ; and in Whitehaven it rose as high as 29. Measles, scarlatina, and whooping-cough have been prevalent in Carlisle ; small-pox in Keswick, where there were 60 cases of the disease, and 5 fatal ; and the same disease has prevailed in the town of Cockermouth. "Fever" was exceedingly fatal both in the town of Whitehaven and at St. Bees.

The town of Salisbury affords a striking testimony to the good effects of drainage and water supply. The Registrar writes :—

"The number of deaths is far below the average, and it is the least registered in any quarter during the last five years. The healthy state of this district is to be attributed to the improved sanitary condition of the town. Within the last ten years a Local Board of Health has been established. The open drains that ran through the streets have been filled in ; a complete system of drainage has been carried out, and waterworks established, by which a plentiful supply of pure water is obtained. These works were begun in 1853 and finished in 1854 ; and the mortality of the district

has materially decreased since that date. During the last five years the annual average number of deaths has been only 185, while those for previous corresponding periods were 328·8, 261, and 215·6 respectively. The number of deaths for the last year, ending June 30th, was 162, which, taking the population at 9,000, gives only 18 to 1,000. The number for the last quarter is very remarkable, only 20 deaths occurring, while the average for corresponding quarters during the last five years is 38·4."

Mr. Leigh, the Registrar of Deansgate, Manchester, has made some observations on dispensaries. He censures the rule by which applicants for the benefit of those institutions must be provided with a *recommendation* as "worse than useless," by entailing the loss of important time, and other hurtful consequences.

Fourth Quarter.—October, November, December, 1863.

The general result of the Quarterly returns is favourable. Rising with an increasing population the number of marriages was greater than it had

ever been before in any quarter. The marriage-rate (*i. e.* proportions of persons married to population) was high, though in some previous instances it had been higher. The births are returned for the last quarter of the year, and greatly exceed the average; while the deaths are also above the average, but to a much less extent.

In spite of some discouragement the year of the marriage of the Prince and Princess of Wales has been the anniversary of more than the usual number of such celebrations. The birth-rate of the year 1863 is the highest that has been observed in England; and the rate of mortality, owing chiefly to the prevalence of fever and of scarlatina, is also higher than is usual.

Marriages.—In the December quarter of 1863 the marriages were 51,904. They were about 3000 more than they had been in the corresponding quarter of 1861, or in that of 1862. The following divisions of the Kingdom have contributed in a prominent degree to this result: —the West Midland Counties, the North Western (the seat of the cotton manufacture), Yorkshire, the Northern, and the Welsh divisions. The populous districts of the cotton and woollen manufactures, as well as those of coal and iron, showed increased activity in nuptial celebrations, the result of increased or continued animation in their respective branches of industry. In Staffordshire the marriages rose from 2009 and 1955 in the December quarters of 1861–62 to 2294 in that of 1863; in Lancashire from 6078 and 5362 to 6499; in the West Riding of Yorkshire from 3807 and 3800 to 4278; in South Wales from 1695 and 1771 to 1831. The following large town districts are selected as examples of increase of marriages in the last quarter of last year:—

December quarter	1861.	1862.	1863.
Stockport	218	198	257
Liverpool, West Derby, and Birkenhead	1543	1663	1904
Manchester, Salford, and Chorlton	1475	1285	1488
Ashton	271	235	295
Blackburn	281	181	322
Preston	254	197	261

In England and Wales about 8000 persons entered into wedlock weekly. In London the number was about 1200.

The annual marriage-rate, viz. persons married to population, was 1·996 per cent., the average being 1·96. It is invariably highest in the last three months of the year, when the full employment of summer is succeeded by comparative leisure, and the earnings of harvest are not yet *drawn* for winter service.

The marriages in 1863 were 173,510. The marriage-rate of the past year was 1·688 against an average of 1·66.

Births.—178,297 births were registered in the last quarter of the year 1863; and the birth-rate of the quarter was 3·428, which is considerably above the average rate of the autumn quarter. Children are not born in equal numbers throughout the year; and, in general, births are at the highest in the winter quarter, and at the lowest in the autumn quarter of the year. But the seasons of the last year were exceptional, for the birth-rate was highest in the spring, and lowest in the summer quarter; and in all the quarters the rate was above the average.

The account of 1863 makes the registered births in that year 727,417; and the birth-rate is 3·539, or 0·111 above the average (3·428) of the ten preceding years. The births exceeded by 14,733 the births in the year 1862, which was itself more prolific than any year that had gone before it.

It is shown in the Census Report that the number of wedded child-bearing women is increasing faster than the general population, and this partly accounts for the increase of the birth-rate.

Increase of Population.—As the births were 178,297, the deaths 115,116, the ascertained natural increase of population in the last quarter of the year was 63,181. About 15,319 persons of English origin emigrated during the quarter. The emigrants from the United Kingdom of which the Emigration Commission furnishes an account amounted to 43,123, of whom about 2850 were foreigners.

68,280 emigrants of English origin sailed from ports at which there are emigration agents in the year 1863; and of their number 36,312 sailed to the United States, 2843 to the North American Colonies, 27,487 to the Australian Colonies, and 1638 to other places. The emigrants from the United Kingdom in the year were 214,555, after excluding 9203 foreigners who sailed from British ports.

Allowing for unregistered births, and for emigration, the increase of the population of England was about 215,000 in the year; while the emigration from Ireland reduced the rest of the population, so that the probable increase of the United Kingdom was about 190,000.

The Registrar General of Ireland is now empowered to register births and deaths, and under his able superintendence the country will learn the exact numbers in that part of the United Kingdom during the ensuing year.

Prices, Pauperism, and the Weather.—Fortunately for the country, while the price of meat remained nearly stationary, the prices of wheat and the prices of potatoes were kept down by the abundant crops, and this

was as advantageous to the people at large, as it was to the monetary world. Beef by the carcase at the London markets was quoted at 4*d.* and 6¼*d.* in the autumn quarters of 1861, 1862, and 1863; mutton in the same quarters at 4¾*d.*, 5¼*d.*, 5*d.* and 6¾*d.*, 6¾*d.* and 7*d.* The average price of beef in the last quarter was 5⅛*d.*, of mutton 6*d.* a pound. Wheat in the corresponding autumn quarters was 59*s.* 3*d.*, 48*s.* 2*d.*, and 40*s.* 6*d.*; potatoes 6*s.*, 5*s.*, and 3*s.* 6*d.* a hundredweight wholesale. While potatoes were 137*s.* a ton in 1862, they fell to 101*s.* in 1863. Wheat in the last autumn was 40*s.* 6*d.*, to which it fell progressively from 59*s.* 3*d.* in the autumn of 1861. The average price of wheat was 55*s.* 5*d.* in 1862, and 44*s.* 8*d.* in 1863; the reduction was 19 per cent.; and the wheat entered for home consumption fell from nearly *ten* to less than *six* million quarters.

The paupers in the receipt of relief were 951,927 in 1862, and 989,685 in 1863; but the distress culminated in the first three months of the year, when 1,085,581 paupers were on the lists, which at the end of the year contained 935,012; a number less by 105,165 than the paupers of the corresponding quarter of the previous year. The change is still greater in the cotton districts, where, as we learn from the report of the Central Executive Committee, the numbers in the receipt of relief from the guardians and from local committees was 448,955 in the last week of November 1862, and 170,850 in the last week of November 1863. It is difficult to conceive what the distress and the mortality might have been in the manufacturing districts had it not been for the Poor Law and for the charity of the nation, which has placed 1,322,493*l.* at the disposal of the able committee of which Lord Derby is the chairman.

The weather of the quarter presented some peculiarities. The temperature at the latter end of October and the beginning of December was colder than the average of the season at Greenwich; but the mean temperature of the season was 3°·2 above the average of 92 years. The rain in three months was 4·6 inches, which is 2·5 inches below the average. The water supply was therefore in some degree defective. Fog prevailed on 66 out of 92 days. Violent storms blew, particularly about the middle of the quarter, and swept the face of the earth.

Deaths and State of the Public Health.—The deaths in the last ninety-two days of the year were 115,116; and the mortality was at the rate of 2·213 per cent., or ·035 above the quarter's average. The mortality was at the rate of 2·422 in the chief town districts, and of 1·944 in the country and small districts; the mortality in the towns being near its average, and in the country above its average.

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1859.

473,837 deaths were registered in the year; and the mortality was at the rate of 2·305 per cent.; the average of the preceding ten years being 2·211. The death-toll instead of 22 was 23 in 1000; so of every 1000 living *one* was sacrificed in the year. The mortality of the year in the chief town districts was at the rate of 25, in the rest of the country 21, per 1000.

AVERAGE ANNUAL RATE of MORTALITY in the 11 DIVISIONS of ENGLAND in the 10 Years 1851–60, and in each of the Years 1862 and 1863.

DIVISIONS.	Average Annual Rate of Mortality per 1000 in 10 Years, 1851–60.	DEATHS ANNUALLY TO 1000 LIVING.	
		1862.	1863.
I. LONDON	23·63	23·38	24·83
II. SOUTH EASTERN COUNTIES	19·55	18·09	19·88
III. SOUTH MIDLAND COUNTIES	20·44	19·16	21·68
IV. EASTERN COUNTIES	20·53	19·28	22·00
V. SOUTH WESTERN COUNTIES	20·01	18·74	21·51
VI. WEST MIDLAND COUNTIES	22·35	21·07	22·69
VII. NORTH MIDLAND COUNTIES	21·10	19·52	21·68
VIII. NORTH WESTERN COUNTIES	25·51	25·07	25·84
IX. YORKSHIRE	23·09	23·23	25·18
X. NORTHERN COUNTIES	21·99	22·42	23·30
XI. MONMOUTHSHIRE AND WALES	21·23	20·74	21·01

The number of deaths was higher in every division than it was in the corresponding quarter of 1861; and also in 1862, except in London in the West Midland Division, in the North Western (Lancashire and Cheshire), in Yorkshire, and in the Northern Division, where the deaths were less numerous than they had been. The deaths in the South Eastern Division rose from 8427 in the last quarter of 1861 to 9255 in the corresponding quarter of 1863; in the South Midland Division from 6176 to 6958; in the Eastern Division from 5552 to 6016; in the South Western Division from 8474 to 9708, where Wilts and Cornwall were the greatest sufferers.

Yet in Salisbury only 24 deaths were registered out of a population of 9039. This city was formerly one of the unhealthiest small cities in the kingdom; and in the ten years 1841–50, the mortality was at the rate of 28 in 1000: cholera with diarrhœa was fatal in the epidemic of 1849 to 20 in every 1000 of its inhabitants. Aroused into activity on the approach of the second cholera epidemic, a Local Board of Health was appointed, and proceeded to do its work effectively. The open drains running through the streets were filled up, a *complete system* of drainage

was carried out, and works were established which provide a plentiful supply of water. These municipal reforms, commenced in 1853, were completed in 1854; and the death-toll has been levied with less severity ever since the year 1855. The mortality in the ten years 1851–60 fell to 24 in 1000, and though higher in the first was lower in the last five years of this period. The mortality was at the rate of 27 in 1862, and 15 per 1000 in 1863. The full effects of sanitary improvements only become apparent after some years; and the disturbance of the seeds of disease is sometimes followed by epidemics, as was apparently the case in Salisbury, where the mortality was at the rate of 29 and 27 in 1000 during 1854 and 1855; while in 1856 the mortality fell to 22, and after some fluctuation to 18 in 1860 and 1861. This happy healthy state was disturbed by epidemics of measles and whooping-cough in 1862, when 240 people died from all causes, and the mortality was at the rate of 27 in 1000. In the year 1863 the vigilance of the Board of Health was again rewarded, and the mortality fell to 15 in 1000; thus justifying the sanguine Registrar when he says:

"In my previous report I stated that in my opinion the low rate of mortality was owing to the completeness of the sanitary improvements lately carried into effect, and I attribute the continued favourable state of the public health in this district to the same cause. It is a remarkable fact, that in a population of 9,039 the deaths have been only 44 in a half year."

At the rates still prevailing in other towns the deaths in a half year would have been 113; thus 79 lives were saved. The Sick City, healed in his county, is a cheering memorial near the ashes of Lord Herbert, which lie above Salisbury on a tributary of the Avon. But, as experience proves, the health of a city, like the sacred fire on the altar, requires the constant vigilance of its guardians, otherwise its flames expire.

Staffordshire and Warwickshire, in the West Midland Counties, as well as Yorkshire and the Northern Division, experienced a higher rate of mortality in the last quarter than they did in the corresponding quarter of 1861, but a lower rate than they experienced in 1862. This was also the case with Lancashire and Cheshire.

The mortality of the year 1863 in every division, except Wales, was above the average of the ten years 1851–60; and although the mortality of every division in 1862, except Divisions IX. and X., was below the average, the increase can scarcely be regarded without regret and alarm. It was due to fever and to a destructive epidemic of scarlatina, or scarlet fever as it is sometimes called, which spread over the country, and was most fatal. This zymotic disease was brought to light by the Arab physicians, but was confounded with fever, measles, and rosalia, until it was described scientifically by Sennert, by Sydenham, and by Morton, at the close of the seventeeth century, and again by Withering. Dr. Richardson has investigated scarlatina with great acuteness recently. It is an infectious disease, still requiring further study, as all its modes of propagation are not yet known, and little is done for effectually arresting its progress. The zymotic matter (*scarlatinine*) floats in the air of unventilated rooms, is attached to the clothes and furniture, and its corpuscles are apparently collected in the middens, the cesspools, and the drains, whose contents should be disinfected and deposited in the soil.

The Registrars report that scarlatina was unusually prevalent in the following sub-districts: Woking; Maidstone, East and West, 49 deaths by scarlatina, 132 by other causes out of a population in 1861 of 23,016; Teynham (Faversham), where typhus also prevailed; Eastbourne, 23 deaths from scarlatina, 50 from other causes, out of a population of 8127; Newport and Calbourne (Isle of Wight); Hursley (Winchester); Basingstoke, 23 out of the 67; Coleshill (Faringdon), 5 out of a population of 464; Baldock, 15 deaths; Hertford, 29 out of 66 deaths; Berkhampstead; Oxford; Northampton (St. Giles and All Saints), 58 deaths; Higham Ferrers; Newborough (near Peterborough); Ramsey (Huntingdon), 17 out of 38 deaths; Warboys and St. Ives; Cherryhinton (near Cambridge); Soham; West Ham, 26 from scarlatina, 7 from

typhoid fever, and 8 from small-pox; Bobbingworth, where typhoid fever and diphtheria also proved fatal; Tollesbury (Maldon), 6 of the 12 deaths were from scarlatina; Harwich, 22 deaths from scarlatina and 28 from other causes; Colchester (First and Third Wards), 32 from scarlatina; Coggeshall (near Kelvedon); Saffron Walden; Sudbury, where 44 of the 107 deaths were from scarlatina; Bury St. Edmund's; Eye, 21 deaths from scarlatina; Stradbroke; Ipswich, St. Margaret, 35 of the 98 deaths were from scarlatina; Eynsford, where diphtheria as well as scarlatina prevailed; East Dereham; Fakenham; Hillington (near Lynn); Marlborough; Melksham; Trowbridge; Heytesbury; Pewsey; Poole; Wareham; Ashburton; Buckfastleigh (Totnes), where 17 of the 35 deaths were from scarlatina; Plymouth, 48 deaths from scarlatina; Tavistock; Tiverton; Shebbear (the registrar of which earnestly begs for the interference of the General Board of Health, as measles and typhoid fever have been prevalent during the last six months); Looe; Newlyn (St. Columb); Grampound, 29 deaths from scarlatina and 27 from other causes out of a population of 5111; Truro, St. Agnes, 33 of the 75 were from scarlatina; Falmouth; Constantine (near Falmouth); Penzance, 56 deaths from scarlatina; St. Buryan (Penzance), 15 were from scarlatina and 8 from other causes, out of a population of 2488; Lansdown (Bath); St. Augustine, Bristol; Clifton, 56 of the 122 deaths were from scarlatina; St. George near Bristol, 28 of the 70 deaths were from scarlatina; Burton-upon-Trent; Tamworth, 22 of the 74 deaths were from scarlatina; Fazeley (near Tamworth), 52 were from scarlatina and 44 from other causes, out of a population of 6857; the three sub-districts of Worcester, 131 out of the 309 deaths were from scarlatina; Foleshill, 23 deaths; Holy Trinity, Coventry, 31 deaths; Hinckley, where measles was also fatal in 22 cases; Earl Shilton (near Hinckley), Leicester East; Oakham; Hayfield (near Stockport); Glossop; Hazelgrove (Stockport); Daresbury (Runcorn); Wallasey (Birkenhead); St. Thomas, Liverpool; Warrington, where 181 of the 314 deaths were from scarlatina; Latchford, where 32 of the 45 deaths were from scarlatina; Chorlton-upon-Medlock; Hulme; Ancoats and Newton (Manchester); Castleton Without (Rochdale); Dalton (Ulverston); Gargrave (Skipton); Nether Hallam (Ecclesall Bierlow); Sheffield South; Sheffield Park; Sheffield Brightside; Goole; Micklegate and Walmgate (York); Sutton and Drypool (near Sculcoates), where 59 of the 169 deaths were from scarlatina; Hull, the three sub-districts, where 117 of the 438 deaths were from scarlatina; Kirkleatham (Guisbrough); St. Oswald, Durham; North Bishopwearmouth; Sunderland, East and West; Monkwearmouth; Westoe (South Shields); St. Mary, Carlisle; Pontypool; Newport (Monmouthshire); Maesteg (Bridgend); and Machynlleth.

The mortality of the North-western Division (Lancashire and Cheshire), instead of being 17, was nearly 26 (25·51) in 1000 during the ten years 1851–60; it was 25·07 in 1862, and 25·84, or a little above the average, in 1863. The people of Lancashire have been so busy in clothing the world that their workpeople have been neglected, and been destroyed by thousands every year, for the want of the most elementary sanitary conveniences, which we may hope will now be provided under the Public Works Act.

Health of London in 1863.

The population of London is so vast, that it is subject to no accidental fluctuations; yet as the tide in some years carries more and sometimes less water from the sea into the Thames, so in some years the stream of

new comers into the population rises above and sometimes falls below the standard. The observations on the movement of the population have hitherto given, as the result of income and outgo, clear proofs of the greater strength of the influx; and judging by the past, about 44,266 souls were added to the population in the year 1863; 31,059 by excess of births, 13,207 by excess of immigrants over emigrants.

The births were 102,119 and the deaths 71,060 in the year. In 1853 the births were 82,254, the deaths 60,069, so the increase of the deaths is 10,991 and of the births 19,865 in ten years. The more rapid increase of births shows some improvement in the registration, which requires from the Registrars the utmost watchfulness.

The death-rate is 2·447 per cent. annually. The death-rate is slightly above (·024) the average of the last 24 years.

The following Table exhibits the numbers of males and females at different ages in London, as found on 8th April 1861:—

All Ages.	Under 5 Years.	5–	10–	15–	20–	25–	30–	35–	40–	45–	50–	55–	60–	65–	70–	75–	80–	85–	90–	95 and upwards

F. 1,496,208	181,403	150,924	133,550	139,206	154,841	140,367	122,012	102,151	93,832	71,408	61,231	43,202	40,878	25,322	18,862	10,061	4,821	1,615	412	110

In England the proportion of Females in the population to Males is nearly as 105 to 100. In London it is as 114 to 100. The excess of Females is apparent in each quinquennium.

If we take the two decenniads the mortality in the first (1840–9) is at the rate of 25·16, in the second (1850–9) at the rate of 23·63 per 1000 of the population; thus showing a progressive improvement of 1·53 deaths less in 1000 living during the second decenniad. Dividing the twenty years into quinquenniads, the rates of mortality were 24·44, 25·88. 24·17, and 23·08; and in the last four years 23·43.

The mortality was low (22·49) in 1860, and since then has slowly increased to 24·47. This fact should arouse the vigilance of the Boards of Works, for if they cease to carry out the recommendations of their health officers, the ground gained will be lost, and London will no longer be the healthiest large city in the world.

It must be borne in mind that the loss of life in London was formerly much greater in proportion to the population than the loss of life among the English in India; and that its present salubrity is as much the creature of art, imperfect it is true, as the fertility of the soil of Holland,

* This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year.

which the sea once covered. If the sanitary dykes be neglected, the three millions of people may again be overwhelmed by cholera, dysentery, and the plague, which are now relegated to the filthy cities of the Mediterranean and of the tropics.

What London wants is a constant supply of pure water, well-aired dwellings, drainage, and the removal of all the manure to the fields. Grand engineering works sometimes dazzle the understanding, and are accepted as substitutes for substantial efficiency, but they are only of use so far as they discharge these humble but useful functions.

London is divided into five groups of districts; and the mortality of the year in the west districts was at the rate of 23·24; in the districts south of the Thames 23·33; in the North districts 23·77. Thus over these great districts the mortality was nearly uniform, the rate having slightly exceeded 23 in 1000. The East districts lost annually 26·48 and the Central districts 26·51 in 1000 inhabitants. The mortality of the South group of districts was below its high average of the previous years, probably owing to the supply of a less impure water. It is one of those instances in which we have decisive proof of the influence of river water, saturated with nightsoil impurities.

If we take 17 in 1000 as the standard rate of mortality in a healthy population, the mean mortality of London in 1860–3 (23) yields in round numbers 6 unnatural deaths annually on every 1000 inhabitants; or 17,426 on the year, and 334 weekly. The end to aim at in London is the prevention year by year of the unnatural deaths, which are the direct result of conditions which to a large extent are under the control of the General and District Boards of the Metropolis.

The excess of mortality in the year is principally due to the zymotic class of diseases, which killed 13,276 persons in 1860 and 20,672 in 1863. 1996 persons died of small-pox in London, notwithstanding all the facilities for vaccination; 366 died of the same disease in the previous year, when measles was fatal to 2334 lives, while in the year 1863 its victims were 1634.

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer.

Fever prevailed in the years 1862–3, and no less than 3598 and 2808 deaths were ascribed to typhus, under which typhia (typhoid fever) and typhinia (relapsing fever) are still included, as their diagnosis is not attempted by all practitioners.

The late Dr. George Gregory, in his classical lectures on the eruptive fevers, described the ravages of scarlatina with the hand of a master. "The years 1838, 1839, 1840 were," he says, "years of epidemic pre-"valence. It is probable that no epidemic of similar length and intensity "ever before visited this country. In the whole year (1839) the deaths "were 2500."*

Since that date the epidemics of scarlatina in London have frequently swelled the mortality; and in 1858–59 the deaths were 4184 and 3481; but in 1863 the deaths amounted to 4955. Since the time that Dr. Gregory wrote, diphtheria has sprung into existence, and the deaths of the year from that disease were 799.

2384 deaths from diarrhœa, 159 from cholera are recorded; and 3 from glanders.

Of alcoholism 231 persons died; 127 of delirium tremens, 104 of the common forms of intemperance. Bronchitis was nearly as fatal as it has been in any one of the last eight years; 6001 persons died of this disease, and 3680 of pneumonia.

547 women died of childbirth and its consequences, including 220 deaths by metria, sometimes called puerperal fever. This proportion is large; for, on the mothers giving birth to 102,119 children, it is more than 5 in 1000.

The violent deaths in London were 2507; of which 2138 were ascribed, chiefly by Coroners' juries, to accident (or negligence), 122 to homicide, 238 to suicide, and 1 to execution. Of the deaths by accident or negligence, 829 were brought about by fractures, 333 by burns and scalds, 61 by poison, 349 by drowning; thus fire and water are nearly equally destructive to life in London. Suffocation, chiefly of children, in bed or elsewhere, is becoming more prevalent than it ever was.

Mr. Glaisher's Tables deserve careful study; they show that the mean temperature at Greenwich was 50°·3; or 1°·9 above the average of 92 years. The winter was peculiarly mild, and so was the autumn; the first was 4°·2, the last 3°·2 above the average; the summer was 0°·7 lower than the average. The humidity of the atmosphere, taking saturation at 100, was 80; or 2 below the average of 22 years. The barometer was above the average, and the rain-fall was 20 inches, or 5·3 inches below the Greenwich average.

GREAT BRITAIN.

In Scotland 44,174 persons were married; the births of 109,325 children were registered; 71,421 persons died in 1863. In Great Britain persons married were 391,194; births 836,742; deaths 545,258. The

Table XXX.—Estimated **Population, Marriages, Births,** and **Deaths** in **Great Britain,** in the Year **1863.**

	Area in Statute Acres.	Estimated Population in the middle of the Year 1863.	Marriages.	Persons Married.	Births.	Deaths.
England and Wales -	37,324,883	20,554,137	173,510	347,020	727,417	473,837
Scotland - - -	19,639,377	3,101,345	22,087	44,174	109,325	71,421
Great Britain -	56,964,260	23,655,482	195,597	391,194	836,742	545,258

* Pages 138-9.

united populations of England and Scotland comprised in the middle of the year (according to estimate) 23,655,482 persons.

The marriage-rate in Scotland (1·424 persons to 100 living) was less than the English marriage-rate (1·688). That of Great Britain 1·654. The Scotch birth-rate was 3·525, slightly less than the English, 3·539. The British rate 3·537. The death-rates of the Northern and Southern portions of the island were almost identical. The English death-rate, 2.305, is sufficiently near to be quoted, as also the British death-rate. England, with her metropolis almost as populous as the northern kingdom, and with many other great city populations, is as healthy as Scotland, which affords an average space of six acres to a person, while in England the area is less than two acres. The town population of England is to its whole population as 54 to 100. In Scotland the proportion is only 37 in 100 parts.

England, France, Austria.—The marriage-rate in France is almost invariably less than that of England, while in Austria it is usually higher. In 1863 the marriage-rate in England was 1·688, in France 1·600, in Austria 1·734 (persons married to 100 living). The birth-rate in England is always higher than in France and less than in Austria. In 1863 it was in the three countries 3·539, 2·686, and 3·988. The Austrian

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

TABLE XXXII.—**Estimated Population** of **England, France,** and of **Austria, 1853** to **1863.**

Years.	England and Wales.	France.*	Austria.‡
1853	18,404,368	36,225,000	21,227,930
1854	18,616,310	35,910,406	21,240,494
1855	18,829,000	35,974,930	21,014,129
1856	19,042,412	36,039,364	21,148,200
1857	19,256,516	36,154,398	21,774,412

1862	20,336,467	37,532,888†	22,841,580
1863	20,554,137	37,722,068†	23,078,057

* M. Legoyt, director of the Statistical Department of France, has favoured the Registrar General with the returns of France for the years 1853–63.

† Including the three newly annexed departments.

‡ Dr. Ficker, chief of the Statistical Department of Austria, has favoured the Registrar General with the returns of Austria. The population returned above is exclusive of Hungary, Croatia, Slavonia, and Transylvania. The population enumerated for the year 1857 and estimated for the entire empire, for each of the other years 1853–63, is 33,834,743; 33,840,907; 33,528,433; 33,763,157; 34,499,755; 34,822,519; 35,228,383; 35,594,418; 35,905,908; 36,235,552; and 36,651,824 respectively. (See also Tables XXXIII., XXXV., and XLI.)

death-rate is very high; in 1855 it was 5·139. It is always higher than the French and English rates. The mortality is generally higher in

1863	473,837	846,539	693,016	2·305	2·244	3·110

* The returns for France in the years 1861, 1862, and 1863 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1853-62.

† The returns for Austria exclude Hungary, Croatia, Slavonia, and Transylvania: but the proportions per cent. are estimated to represent the rates prevailing in the entire empire.

France than in England. In 1863 the English rate was 2·305, the French 2·244, the Austrian 3·110.

In Italy the marriage, birth, and death rates were 1·626, 3·912, and 3·115. The first was low; the second and third high. The birth and death rates agreed nearly with those of Austria.

I have been favoured by his Royal Highness the General Commanding-in-Chief with a return of the strength of the army serving abroad in 1863, and the deaths in the same period. The strength was 6243 officers, and 125,473 non-commissioned officers and men; the deaths of the former 99, of the latter 2110.

The mortality of officers is always considerably less than that of men. In 1863 the rates that prevailed in the two classes showed an unusual

---

TABLE XXXIV.—**Italy. Population, Numbers,** and **Proportions per Cent.** of **Marriages, Births,** and **Deaths,** exclusive of still-born, in each of the Years **1862** and **1863.**

	Total	2,158	1,359	3,517

* British subjects are not particularly described upon Schedule C., but foreign names have been excluded from this account.

† The deaths of soldiers, marines, and invalided seamen from the Royal Navy were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, and 116 in 1863. The number is 947 in eight years, which, if added to the 3517 above, makes 4464, the total number of deaths of British subjects at sea in 1856–63, exclusive of those of merchant seamen.

There were born at sea in the year 344 children, British subjects. This number is exclusive of the children of seamen. And 694 British subjects, other than merchant seamen, died at sea in the same period.

TABLE XLIII.—**Mortality** of **Merchant Seamen at Sea,** in the 12 Years **1852-63.***

YEARS.	STRENGTH.	DEATHS.	ANNUAL RATE OF MORTALITY. To 100 living.

In the 12 years 1852-63	2,065,823	39,820	1·93

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether "supposed to be a British subject or Foreigner" might be attempted. British and Foreign *seamen* are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

TABLE XLIV.—**Aggregate Number of Names on the Registers** at the End of each Year **1837-63** ; also the **Number of Searches for Registers** at the **Central Office** (exclusive of Searches in Non-parochial Registers).

NOTE.—The numbers registered in 1837 are for the Half Year ending December 31st.

Names on the Registers, and Searches.

In the last half year of 1837, and in the 26 subsequent years, 33,997,135 names were inscribed on the registers as those of persons who had been born or married, or who had died. In 1863, 7715 searches were made at the Central Office, amongst that vast though not unnumbered throng of names, which its records associate with one or more of those three important events,—the landmarks in the physical existence of each human being.

For an account of the Causes of Death in 1863, I beg to refer you to a letter addressed to me by Dr. Farr, which will be found in the Appendix.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

ANNUAL ABSTRACTS

OF

BIRTHS, DEATHS, AND MARRIAGES.

1863.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or t greater part of the population is located, the limits of the Regi tration Counties differ more or less from the boundaries of t Counties proper.

Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions: in these cases two ceremonies are entered as two marriages. This column includes 20 cases of divorce, viz., 10 *men divorced* who married spinsters, one *man divorced* who married a widow, 6 bachelors who married *women divorced*, and 3 widowers who married *women divorced*. For the districts in which these marriages took place see subsequent pages.

* On 18th July 1863 the parishes of Eglwysilan, Llantrisaint, Llantwitvaidre, Llanfabon, Ystradyfodwg (except Rhigos hamlet), and Llanwonno were severed from the districts of Cardiff (581 *a*) and Merthyr Tydfil (582) to form the new district of Pontypridd (581 *b*). On 24th July the parishes in the sub-districts of Cardiff (581 *a*) were re-arranged. *See* "List of Changes," p. 172.

* In the other 61,333 cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

Ages of 4,356 Bachelors and 4,356 Widows who intermarried in 1863.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the P Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1863—*continued.*

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 641 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83-4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included; *H* indicates Hospital or Infirmary; and *L* Lunatic Asylum.

† For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

‡ Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated. The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

LONDON.—Number of Deaths in the different Classes of Public Institutions during the Year 1863.*

INSTITUTIONS.	Deaths in 1863.	Of the Total Deaths in London the Proportion per Cent. in Public Institutions.
LONDON.—TOTAL DEATHS IN 117 PUBLIC INSTITUTIONS	11,112	15·64
In 46 WORKHOUSES (*a*)	6187	8·70
12 PRISONS (*a*)	64	·09
4 MILITARY AND NAVAL ASYLUMS	289	·41
15 GENERAL HOSPITALS (*a*)	3169	4·46
7 HOSPITALS FOR SPECIAL DISEASES	827	1·16
4 LYING-IN-HOSPITALS — Women	11	·02
4 LYING-IN-HOSPITALS — Children	37	·05
7 MILITARY AND NAVAL HOSPITALS	203	·29
3 HOSPITALS AND ASYLUMS FOR FOREIGNERS	61	·09
19 LUNATIC ASYLUMS (*a*)	264	·37

(*a*) In London, at the Census of 1861 (April 8th), the inmates of 45 Workhouses were 23,745, of the 12 Prisons 5,612, of the 15 general Hospitals 3,123, and of 18 Lunatic Asylums 3,102. The officers of the institutions, their families, and the infant children of female prisoners, are not included in these numbers or in the number of deaths. One Workhouse (belonging to the Stepney Union, but situate in Poplar 25; 1), and one Lunatic Asylum (in Hackney) included in the Table, have been instituted since the Census of 1861.

DEATHS in PUBLIC INSTITUTIONS in each District of LONDON during the Year 1863.

ENGLAND.—Supplementary Table of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

(*continued at page* 128.)

Causes of Death at different Periods of Life, in the Year 1863.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

* NOTE.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in *hospitals* proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the Military and Naval Hospitals, in Wandsworth for the County Lunatic Asylum, and in the other London Districts for Workhouses situated out of the Districts to which they belong.

In all the other Districts of England the second rate of mortality is the result on a correction for either a Naval or Military Hospital or Camp, a County Lunatic Asylum or a Workhouse situated out of the District to which it belongs. The particulars of these corrections are given in the Supplement to the 25th Report, pp. xi-lviii.

Population 1861. Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1863, in the Districts of England—*continued.*

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND in 1863, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L. . . . 175–195

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1863.

Sir,

It is shown in your Report that the deaths were more numerous in this than in any previous year, and that the rate of mortality was high.

The causes of death to which the increase of mortality is chiefly due are in the zymotic class, and are most fatal to children.

The mortality is shown in Table I. to have been below the average at the several ages after 10, but to have been much above the average under that age in both boys and girls. The high mortality of the year is created by an excess of children's deaths.

Table I.—**Excess** or **Defect** of **Annual Rate** of **Mortality per Cent.** of **Males** and **Females** in **England** and **Wales** in the **Year 1863** over or under the **Mean Annual Mortality** of the **26 Years 1838-63**.

	AGES.—MALES.											
	All Ages.	0–	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 & upwds.
Mean of 26 Years –	2·314	7·236	·889	·4 9	·793	·975	1·374	1·806	3·133	6·711	14·658	30·368	43·770
Year 1863 – – –	2·421	7·743	1·031	·503	·739	·968	1·330	1·729	3·055	6·924	14·084	31·245	48·848
Excess of 1863 –	·110	·507	·142	·004	–·054	–·007	·056	–·077	–·078	·213	–·574	·877	5·078

The Table may be read thus:—The Mortality per Cent. of Males in the Year 1863, under 5 Years of Age, exceeded the Mean Mortality per Cent. of 26 Years by ·507, while, on the contrary, at the age 45 and under 55 the Mortality in the Year 1863 was *less* than the Mean Mortality of 26 Years by ·077; the deficiency being indicated by prefixing the minus sign thus (–·077).

	AGES.—FEMALES.											
	All Ages.	0–	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 & upwds.
Mean of 26 Years –	2·145	6·236	·881	·518	·828	1·019	1·232	1·550	2·804	5·813	13·371	28·003	42·929
Year 1863 – – –	2·193	6·715	·998	·521	·766	·955	1·161	1·505	2·897	5·091	13·137	28·922	43·555
Excess of 1863 –	·048	·479	·117	·003	–·062	–·064	–·071	–·045	·093	–·722	–·234	·919	·626

The great reigning disease of the year is SCARLATINA, which killed 30,475 children (chiefly). Diphtheria prevailed with some malignity; and this disease, which never figured in the returns before 1859, was fatal to 6507 children (chiefly). Small-pox, and croup, and diarrhœa were also prevalent.

While 4·551 in 1000 people died of zymotic diseases in the year 1862, the mortality from this class of cases alone was 5·887 in the year 1863. The difference is 1·336; and nearly the whole of it is accounted for by the above diseases.

The causes of 4955 deaths were not recorded; and of 3008 deaths the Coroners and other informants only enable us to infer that they were sudden. Causes of the remaining 465,874 deaths are recorded.

Class I. Zymotic Diseases.

The deaths by zymotic diseases amounted to 119,731, and they constitute one fourth of the total deaths, while they were in the proportion of

5·887 to 1000 living persons. Of the diseases in the class 114,538 were of the miasmatic order.

Small-pox was epidemic in many districts, and destroyed 5964 lives. It is less fatal than it was; but many lives are sacrificed every year by the negligence and ignorance of the parents, on whose care the children's lives depend. Measles destroyed 11,349 lives; whooping-cough 11,275 lives; croup 6957; diphtheria 6507; scarlatina 30,475.

The mortality by scarlatina was at the rate of 1·498 to 1000 persons living of all ages. The mortality by this disease ranged from ·746 to 1·055 in the seven years 1851–7. In the year 1858 the mortality by the disease rose suddenly to 1·572. It included malignant sore throat (cynanche maligna), with which diphtheria was at first confounded. In 1859 the character of diphtheria was generally understood; and of the mortality (1·513) the third part (·492) was ascribed distinctly to diphtheria, the rest (1·021) to scarlatina. The mortality in the next four years (1860–3) ran thus; scarlatina ·493, ·456, ·738, and 1·498; diphtheria ·265, ·227, ·244, and ·320.

The deaths by scarlatina in the year 1863 under five years of age were 19,222; 8192 at the age 5 and under 10. The mortality is highest in the third and the fourth years of age; but the mortality by scarlatina in youth and manhood is not inconsiderable; 2 deaths at the age of 75 and upwards are referred to this head.

4230 boys and 3962 girls of the age 5–10 died of scarlatina; 770 boys and 881 girls of diphtheria. One third part of the deaths at this age are by scarlatina.

The variation in the distribution of deaths over the ages depends upon the varying susceptibility to attacks, and upon the varying liability to succumb under attacks. The destructiveness of any disease may be expressed by one word, lethality*; and the lethality of the diseases which have for this purpose been investigated diminishes from infancy up to the age of puberty. So the 39,022 deaths in the nine years 1855–63 (see Table IV.) at the age 5—10 imply perhaps as many attacks of scarlatina as 96,280 deaths at the first quinquenniad.

It is the duty of parents to avoid the exposure of children at any age to infectious disease; but the above law implies that zymotic attacks are more lethal, and therefore the more vigilantly to be avoided, in the first stage of life.

TABLE VIII.—ENGLAND. **Deaths** from **Fever—Typhus, Typhia,** and **Typhinia**—to 10,000 Persons living, and Proportional Number to 1000 Deaths, in each of the Fourteen **Years 1850–63.**

1863	16,017	8·86	38
Mean - -	17,144	9·09	41

* Lethare—to kill.

The fevers,—typhus, typhia (typhoid fever, including infantile remittent), and typhinia (relapsing fever),—still demand attention; they destroyed 18,017 lives in the year, or 8·86 in 10,000 of the population. Of 1000 deaths 38 were by these fevers. The mortality was at the rate of 6·63 per 10,000 in 1860, and rose to 7·76 and 9·31 in the two following years. The mortality in the year 1863 is below that of the year preceding, and below the average, 9·09, of 14 years.

The fevers are fatal at all ages; more fatal in the first 5 years of age than in the second, in the second 5 years of age than in the third. The mortality rises to 8·65 for males and 9·16 for females at the age 15—25 of immigration into towns: it falls at 25—35, to rise from that decenniad through every subsequent decenniad of age.

The mortality of females by fever is higher than that of males at all ages from birth up to the age of 25; and after that age fever is more fatal to males than to females.

Dr. Murchison supplied the facts from which the lethality of fevers at different ages was deduced;* and this gives us the means of estimating the number of cases of fever out of which the deaths occurred.

The cases, as directly estimated, are given in Table VII.; and it may be assumed, as the cases in hospital are unusually severe and lethal, that they do not represent more than half the number of fever cases in the country.

It is difficult to overrate the importance of the etiology of these diseases, which are closely allied to plague, and are its representatives in England.

Erysipelas prevailed to a considerable extent, and 1920 deaths by the disease are recorded. Erysipelas is generally described as it appears in adults, but it is fatal in infancy, and of the 1920 deaths, 612 occurred in the first year of age. There was a considerable increase in the year on the deaths of the year preceding, and the increase was observed at nearly all ages.

Metria (puerperal fever) was fatal to 1155 mothers; or to 215 more than died by the disease in the previous year. It is well known that metria and erysipelas are closely allied; and that *erysipeline* induces metria under certain conditions.

Influenza has not recently been epidemic, and its attacks when fatal are often confounded with bronchitis or pneumonia.

Diarrhœa is an intermediate disease between dysentery and cholera, Whenever dysentery and cholera are epidemic, diarrhœa is prevalent;

* See Letter (p. 176, Table III.) in 25th Annual Report of Registrar General.

and continuous series of intermediate cases lie between simple diarrhœa, choleraic diarrhœa, simple cholera, and malignant cholera, cases of which there is good reason for believing always commence by serous effusion

---

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

into the intestines.* In the year 1854 we had 20,097 deaths from cholera, 20,052 from diarrhœa, and 1943 from dysentery; whereas the deaths from these forms of disease were 807 from cholera, 14,943 from diarrhœa, and 1051 from dysentery in the year 1863. Thus while dysentery and

* Dr. Macloughlin showed by close personal investigation that many of the cases of Asiatic cholera, returned in London as without premonitory symptoms, were preceded by diarrhœa.

cholera subsided, diarrhœa still held its ground. Diarrhœa is chiefly fatal in infants and old people. So of the 14,943 deaths, 12,006 occurred in children under 5 years of age; of whom 8459 were infants (0—1).

† Up to the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" wer thrown into one line. This accounts for the changes in the table numbers.

Ague and remittent fever are rarely fatal in England. The disease, sometimes called infantile remittent fever, is classed under the head of typhus in our Tables; as it is a form of typhoid fever (typhia).

TABLE XI.—**Causes** of **Death** in **England** in **1863.** Proportional Numbers dying from each Class of Causes, and from each Cause.

* Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

The enthetic order of diseases is fatal in some of its forms; the 4 deaths by hydrophobia, and 5 deaths by glanders, probably represent all the cases. Syphilis in its various forms is not unattended with danger; but the 1386 deaths represent only a small proportion of the cases. Gonorrhœa is scarcely ever fatal in its primary form; but it gives rise to stricture of the urethra, to which 183 deaths were referred in 1863, and to several of the secondary diseases of the bladder and kidneys.

Only one death was referred to hydrophobia in the year preceding, while 4 died in 1863. The reduction to 4 from 16 and 14 deaths in 1854–5 by this terrible disease was the result of police regulations, which can never be relaxed with impunity.

The four persons who died of hydrophobia in the year were all males; one was a boy of 5—10, 2 were 15—20, and one was 20-25.

Only 2456 deaths were recorded in the dietetic order; namely, 54 from privation, 1158 from want of the mother's milk, 471 from purpura and

scurvy, and 835 from alcoholism. The deaths from alcoholism increased. 471 of the deaths were from delirium tremens, and 364 from intemperance and its various sequels.

Delirium tremens exhibits considerable fluctuations. Thus in 1855 the deaths from it were 536, and in the next year 451; in 1858–9 the deaths were 424 and 545; since that date the yearly deaths have been as low as 415 and as high as 471.

1159 persons died of parasitic diseases; namely, 961 by thrush, nearly all in infancy, and 198 by worms, &c., including 16 by porrigo, 4 by scabies, 3 by tapeworm, and one by hydatid in liver.

Among the zymotic diseases, rarely fatal, are erysipelas after vaccination, the cause of 11 deaths; 3 of males and 8 of females. One of the females was of the age of 5—10, another of the age 45—55; the rest were infants, 7 under one year of age, and 2 were 1 and under 2 years of age. Mumps is not generally a dangerous disease; but to it 84 deaths are ascribed, 52 of males and 32 of females. 66 of the deaths happened under 5 years of age. 5 deaths by miliaria, 3 by yellow fever, and one by malignant pustule are recorded. Rickets is less common than it was formerly; to it 40 deaths of males, 49 of females are referable. It is most fatal at the age of 1—3 years.

II. Constitutional Diseases.

84,393 cases of fatal disease are in this class of cachexies, comprising the diathetic as well as the tubercular order; and the mortality by them was at the rate of 4·150 per 1000 living. 18 in 100 fatal diseases or injuries are of this class.

Of the 16,651 deaths in the diathetic order, 248 were by gout, 7414 by dropsy, and 7479 by cancer. Dropsy is generally the result of obstructed circulation, an incident in heart affections, or of alterations of the blood, supervening in renal disease; but it is occasionally idiopathic, and a common result of imperfect nutrition. 350 deaths by anæmia are classed under the same head as dropsy, on subtracting them the cases of dropsy fall to 7064.

Fatal tumors are classed under the head of cancer, of which the increase from 5826 in 1854 to 7479 is only apparent, and is probably referrable to improvements in the diagnosis of internal diseases. It is a disease of adults. Among the deaths are 18 by melanosis, 90 by fungus hæmatodes, which occurs at all ages, and is scarcely more fatal to males than to females. Five cases of sweeps' cancer occur, 37 of lupus, and 10 of polypus. The deaths by mortification include 491 by gangræna senilis, and 118 by bedsore. Of 67,742 deaths by diseases of the tubercular order, 51,072 were by phthisis, which will be noticed again, with diseases of the lungs.

III. Local Diseases.

This class comprising all the inflammations of the organs and their consequent changes includes more deaths than any other class; the number in the year was 174,603, or 37 deaths in every 100. The mortality by the local diseases was at the rate of 8·584 per 1000 living.

The brain, the great centre of the nervous system, is the chief seat of 57,428 fatal diseases, of which 2·824 in every 1000 of the population died. Convulsions, chiefly of young children under one year of age, caused 26,008 of the deaths; epilepsy, occurring at all ages after infancy, 2574. These diseases manifest themselves through the muscular system; but the senses and consciousness are also disturbed. So it is also in chorea, which, unlike convulsions, is more fatal to girls than to boys, and is most fatal at the age (15—20) immediately after puberty.

Only 555 deaths are returned from insanity, chiefly owing to the disease giving rise to paralysis, apoplexy, and other fatal head diseases, to which the deaths are attributed. Insane persons die in great numbers of phthisis; that was the case particularly under the old system of cellular incarceration. Six deaths, 5 of women, are ascribed to grief; and 4 to fright in girls of the age of 5 to 20.

9721 deaths are by apoplexy, 9762 by paralysis, — diseases occurring at all ages, but most frequent in advanced, while cephalitis is most fatal in early life. As the nature and transformation of tissues vary, so do their lesions.

The troublesome diseases of the organs of sense are rarely fatal in adults; and of 33 deaths by ophthalmia, 28 occurred under 5 years of age. Otitis, penetrating to the membranes of the brain, is fatal to a small number of persons, 59 males and 29 females of all ages.

Fifty-one deaths by idiopathic tetanus are recorded; the cases occurring after injuries being returned under the head of violence. Some of these cases might have originated in slight or unnoticed injuries.

It is worthy of remark that brain diseases of every kind are less subject to fluctuation than diseases of any other system of organs. And these diseases rarely assume the epidemic form; for only epidemics of dancing mania, hysteria, and some moral delusions can be cited. The chest affections change constantly with the temperature.

The heart is the great centre of the circulatory apparatus; of which the diseases were fatal in 19,505 cases. The deaths by aneurism have increased progressively from 308 in 1854 to 418 in the year.

The mortality by this order of diseases is less than 1 in 1000; which is accounted for by the heart being much less liable to disease in childhood than the brain, lungs, or intestines. The deaths by heart* affections in children under 5 years of age are only 319; while the brain* is the death-seat in 29,033, the lungs* in 31,413, and the digestive organs in 3361 instances. At the ages after 10, if we exclude phthisis from consideration, the heart diseases are nearly as fatal as the other four great orders, up to the age of 55. The heart and blood vessels suffer most comparatively in the vigorous periods of life.

67,280 persons died by diseases of the respiratory organs, making 3·308 deaths per 1000 of the population, and 14·349 per cent. of the total deaths.

TABLE XIII.—**Average Annual Rate of Mortality to 10,000 living by Phthisis and Lung Diseases in England,** for the Three Periods **1850-54, 1855-57,** and **1858-63.**

YEARS.	LUNG DISEASES.	PHTHISIS.	PHTHISIS and LUNG DISEASES.

(6 Years.) 1858-63	33·09	25·74	58·83	0·97

---

* The principal organ is often used in this Letter to characterize the diseases of the whole order.

Phthisis differs essentially in its pathological products, in its complications, and in its fluctuations from bronchitis. For example, the mortality by bronchitis is immediately doubled, or trebled, by a depression of the temperature of the air, while the deaths by phthisis exhibit little variation. But these diseases are often confounded; and the distinction between chronic bronchitis, or the bronchitis of miners, and consumption, was even recently not obvious to many practitioners. Under these circumstances what significance is to be attached to the fact that the mortality per 1000 by bronchitis ranged from ·822 to ·978 in the three years 1850–2; and from 1·558 to 1·648 in the four years 1860–3; while the mortality by pneumonia and pleurisy slightly declined; and the mortality by phthisis ranged from 2·624 and 2·826 to 2·511 and 2·611? Is it to be inferred that there has been an actual decrease of death by consumption, and an increase of death by bronchitis? Is the effect of the treatment by cod liver oil in phthisis visible in the returns?

If we divide the 14 years into three periods, as in Table XIII., it will be observed that the mortality ascribed to phthisis decreased from 2·811 per 1000 to 2·574; while the mortality by lung diseases increased from 2·769 to 3·309; by phthisis *and* lung diseases the mortality in the two periods ranged from 5·580 to 5·883.

To carry the analysis further, the ages of the dying from phthisis and bronchitis must be distinguished; and this is done in the Tables XIV., XV., which show that phthisis reigns from the age of 10 to 55, and after 65 gives place to bronchitis. The mortality per 1000 by phthisis among

males of the age 15—25 was 3·28, 3·12, and 3·10 in the three periods; among females 4·00, 3·93, and 3·76. Again, at the age 25—35 the mortality of males by phthisis was 4·04, 3·93, and 3·94; of females 4·68, 4·51, and 4·46. The decrement is not considerable, but as age advances it becomes greater; it is greater too in the first 5 years of life.

The great increase of the mortality of bronchitis is at the age after 65; but at the age 45—55 the increase is noticeable. The increase in infancy is also considerable.

The mean temperature of the three periods differs little; in the first and last periods it was equal or 49·4°. The year of lowest temperature, 1853, in the first period was 47·7°; in the last period, 1860, it was 47·0°.

By grouping the deaths by bronchitis and phthisis together we obtain this singular result: the mortality at the ages 5—35 declined; at the ages 35—55 the increase of mortality was scarcely perceptible; at all the ages after 65 the increase was considerable. (Table XVI.)

20,516 persons died of disease of the *digestive organs;* by which the mortality was 1·008 per 1000. 12 deaths by pancreatic disease are recorded; 84 by spleen disease; 7681 by hepatitis, jaundice, and liver disease; leaving 12,739 by the diseases of the stomach and intestines. There were 848 deaths by hernia; 301 deaths by hæmatemesis, 192 males, 109 females; 117 deaths by melæna (59 males and 58 females); 16 men and 32 women died of gallstone; 360 men and 207 women of cirrhosis.

The total deaths from the next four orders of disease are 9874, or less than 10,000.

5578 deaths are by diseases of the urinary organs. The numbers increased from 3770 in 1854 to 5578 in 1863. The mortality by stone decreased in the years 1850 and 1863 from ·014 to ·008 per 1000; that from diabetes increased slightly from ·024 to ·027. There was an increase in the mortality by nephria (Bright's disease) from ·024 to ·084; by nephritis and cystitis also the mortality increased.

1219 deaths by diseases of the organs of generation are recorded; including 255 by ovarian dropsy against 280 in the preceding year. Cases of ovarian dropsy recur with great regularity. Orchitis was fatal in 9 cases, hydrocele in 7, pelvic abscess in 4 men, and 26 women, hysteritis in 22 women of the child-bearing age, and probably child-bearing.

1765 persons died of diseases of the organs of locomotion; and chiefly of diseases of the joints and bones. Of exostosis 2 men, one woman died; of mollities ossium 3 men and 9 women; of caries 99 men, 79 women; of necrosis 69 men, 38 women. Necrosis is often the result of blows, to which men are more exposed than women.

1312 deaths by diseases of the integumentary system, including skin and subjacent cellular tissue, are recorded: including 530 deaths by phlegmon, and 435 by ulcer. Of the skin diseases eczema is the most fatal.

IV. Developmental Diseases.

The special diseases of this metamorphic class occur in the processes of reproduction, growth, and natural decay. 71,467 deaths are comprised in the class; from which the mortality is 3·513 per 1000.

Among the developmental diseases of children are 8121 cases of premature birth, 1261 of malformation, and 4116 of teething.

Paramenia or mismenstruation (75), and childbirth (2433), constitute the whole of the second order, which comprizes 2508 deaths. The total deaths from childbirth, including metria, are 3588.

During 17 years, 1847–63, the deaths of mothers by metria and childbirth, to 10,000 children born alive, have been in the proportion of 50; or 1 in 200. And the proportions have ranged from 61 in the year 1848 to 42 in the year 1857. In 1861 and 1862 the proportion was 43; in the year now under review 49. Metria has been to some extent epidemic.

Only 27,268 persons are reported to have died of no designated disease, but of natural decay and old age; the proportion is about 58 deaths in 1000.

In a considerable number of cases children and old people, and to some extent persons of all ages, waste away or lose their strength without any obvious cause. These cases, registered under "atrophy and debility," were fatal in 28,193 instances.

V. Violent Deaths.

15,680 persons died by violence, or by obvious physical and chemical causes. They comprize 33 deaths in 1000; or 1 in 30 deaths. Of the population 7·72 in 10,000 died by these causes. There are besides these deaths others by drowning at sea, and among our army and navy in battle abroad, which go to the diminution of the people. They are not brought here into account.

This important class, which has been the especial subject of legislation, and has attracted more than any other the attention of governments, is divided into five orders; the first comprising deaths by accident or negligence, 13,772; the second by battle; the third deaths by homicide, 399; the fourth by suicide, 1319; and the fifth by judicial execution, 21. The homicides here referred to are undoubted deaths, which, according to the finding of coroners' juries, were manslaughters or murders.

The various ways in which murder, it is supposed, was effected, are displayed in Tables XVIII. and XIX. Of the 258 murders, 81 are infanticides, 34 boys and 47 girls, including infants : 176 children under one year of age, were murdered. Exclusive of the infanticides, 177 persons were murdered; 103 males, 74 females; thus the weaker sex were not the most frequent sufferers; moreover 100 males and only 41 females were manslaughtered.

Exclusive of 176 children under one year of age, 47 males and 35 females were murdered.

One murder only was by shooting; blows, cuts, stabs, drowning, strangling, and neglect were common methods. One boy under one year was poisoned by laudanum; 2 female children, and 2 female adults, were poisoned by prussic acid; one by arsenic and one by oil of vitriol.

The homicides fluctuate little from year to year; and since the year 1858 they have ranged from 16 to 21 homicides annually in every million of the population. The risk of murder in the present state of English society is therefore constant but inconsiderable.

As the homicides exceeded the average in the two last years, so did the executions. It is absolutely necessary for the safety of the public to remove the stock of organic, irreclaimable criminals from society for ever; and execution, which has hitherto been employed, is, as far as the criminal is concerned, the easiest kind of expulsion from unworthy life. But criminality, like insanity, is a disease, and the one state as well as the other should be regarded with the eye of a physician, who administers medicines as remedies, and not for the sake of inflicting pain.

(Not stated how)	64	4	1	–	–	1	6	1	1	3	8	16	13	7	4	1	4	

In the first period of three years 1858–60, the reported annual deaths by homicide and infanticide were 353; in the second period (1861–63) 379; or more by 26 in the last than in the first. The annual executions were 9 in the first, and 16 in the second period.

Only one woman, aged 25—35, was executed in the year, when 20 men were executed, 6 of the age of 15–25; 10 of 25—35; 1 of 35—45; 2 of 45—55; 1 of 65—75.

The returned homicides in 6 years are to the executions as 2196 to 75, or as 29 to 1; while there is no doubt of the fact of death, its cause is frequently by no means clear. Advancing a step further, it may be uncertain, when the proximate cause is clear, as in drowning or suffocation, whether the death was induced by human agency or complicity. And even when the intervention of a human hand is beyond question, evidence may not be forthcoming to bring the crime home to the criminal. It may be suicide; it may be homicide. The intention of the mankiller has to be scanned, and the circumstances, before he can be pronounced guilty of murder. Then the plea of insanity, or, after the verdict, the final appeal to the mercy of the crown, may be successful in rescuing the criminal from execution. Thus it happens that the reported cases of homicide are to the executions in the proportion of *twenty-nine* homicides to *one* execution.

Suicide is returned as the cause of 1319 deaths in the year; so the proportion of suicides on the population is 66 in a million, homicide being 20, and execution 1.

The proportion of suicides to a million of the population on an average of the six years is 67; and the successive numbers run from the year 1858 thus:—66, 64, 70, 68, 65, and 66.

The most common way of committing suicide in England is by hanging, cutting, and stabbing; drowning, poisoning, and shooting follow in decreasing frequency.

TABLE XX.—**Proportion** of **Suicides** consummated to every **1,000,000** of the **Population** of **England** and **Wales, 1858-63.**

Means employed.	1858	1859	1860	1861	1862	1863
Gunshot Wounds - -	3	3	3	3	3	3
Cutting, Stabbing - -	13	14	14	13	11	13
Poisoning - - - -	6	6	8	6	6	6
Drowning - - - -	10	11	11	11	10	12
Hanging - - - -	30	27	30	30	30	28
Otherwise - - - -	4	3	4	5	5	4
All Ways - -	66	64	70	68	65	66

The constancy of these ratios, not only in the act but in the mode of suicide, has struck statists from the first, and it has been particularly well illustrated by M. Guerry and M. Quetelet.

Under the obscure workings of insanity, and amidst the conflict of the passions, in a great variety of unhappy circumstances, an order is observed, which can be expressed in laws, and men can by means of these laws predict past and future events. Thus it is found that 56 persons, 3 women and 53 men, shot themselves dead in the year 1863; and by virtue of the law, if it be assumed that the same number of persons shot themselves in each of the preceding years, the error will not be considerable; for the numbers were 54; namely, 53 men and 1 woman in the year 1862, and 59, 59, 54, and 60 in the preceding years; making the average annual number 57, from which the deviation is only 3 or 1-19th either way. By virtue of this law any one may predict that, the circumstances remaining the same, 57 persons now living will shoot themselves in the year 1866. In the six years 253 persons killed themselves annually by cutting the throat or stabbing themselves; the numbers ranging in those years from 215 to 276; that is from 38 below to 23 above the average.

Some erroneous inferences are sometimes drawn from these remarkable laws. It has been assumed, for instance, that because numbers expressing events, such as suicide, succeed each other regularly year after year, that those numbers are perfectly correct. Now this does not follow, for it has been found that the same law extends to errors, and it is quite possible, nay probable, that the number of suicides in England is understated, as some unknown numbers of the persons found drowned are suicides.

It is established as a law, that the same causes or equivalent causes invariably produce the same effects on the minds of men under the same conditions; but it does not follow from this principle that suicide cannot be brought under any control. A certain number of lunatics destroy themselves; anything, therefore, which prevents or cures lunacy diminishes suicide. In some in-door employments, where the conditions of health are disregarded, the tendency to suicide is developed; and by changing the conditions the tendency is diminished. Idleness, as much as strain of mind, predisposes to suicide; change the conditions and the disposition to suicide is changed. Suicide has generally been treated as an ignominious crime; but it sometimes puts forward pretensions to heroism and applause; it is therefore influenced by public opinion. In certain states the mind appears to be fascinated—as in the disposition to plunge from a height—by the presence of a fatal instrument, such, for example, as prussic acid, a pistol, a rope, or a razor; and the withdrawal of the means of death suffices to save the life. Diminish the facilities of procuring poison, and you diminish the peculiar kind of suicide. Discontinue the use of the razor in a country, and you diminish the cases of cut-throat; which are at present so numerous and so deplorable.

Burns and scalds.

45,460 persons, 22,526 males and 22,934 females, were burnt or scalded to death in the 16 years ending in 1863. The annual sacrifice was of 2841 human bodies in England alone.

It is gratifying to observe some diminution in the number of girls and women burnt in the year. The average number in previous years was 1433; in the year 1863 the number fell to 1306; 127 lives were saved. The proportion to a population of 100,000 was 14·8 and 12·4. Thus allowing for increase of population, *one* seventh of the accustomed tribute of lives was saved from the fire. Among young children of both sexes the saving of life was considerable. Men of the age 25–45 were killed in greater numbers than before, probably in mines and works; but at other ages the numbers of deaths by burning diminished.

TABLE XXI.—ENGLAND. **Deaths** and **Mortality** by **Burns** and **Scalds** in the **Years 1848-63**.

95 and upwards	4	28	—	2	—	2	—	180·7	—	202·6

Of the 12,511 males dying of burns under 5 years of age, 791 were less than 1 year of age, 2993 were 1 year and under 2, 3255 were 2 years and under 3, 3018 were 3 years and under 4, 2454 were 4 years and under 5. Of the 10,308 females dying under 5 years of age, 786 were less than 1 year of age, 2344 were 1 year and under 2, 2423 were 2 years and under 3, 2535 were 3 years and under 4, 2220 were 4 years and under 5.

Subjoined are the suggestions for preventing death by fire, which I reprint from the Letter in your 24th Report.*

The number of these painful and untimely deaths may be much diminished by vigilance. And the press will, I trust, call attention to the subject, which is of incalculably greater importance than the burning of widows in India, or the drowning of witches in the middle ages, which have been abolished by the progress of science.

We burn at present 2766 men, women, and children of all ages annually in England and Wales. I trust that in a future Letter it will be my privilege to report a great reduction in this number.

I have the honour to be,
Sir,
Your obedient servant,
W. FARR.

To
The Registrar General.

---

* "1. *Open fires*, lights, and kettles of hot water, should be surrounded by GOOD GUARDS. This precaution is of capital importance.

"2. Children and young people, and old women, should be systematically taught the danger of fire.

"3. The dresses of young children and old women should be made as

much as possible of worsted or wool; which will protect them against cold, as well as against fire.

"4. The muslin dresses, and cotton and linen clothes, might very properly be starched with the chemical materials which are found by experience to render them, to a certain extent, incombustible.

"5. Private houses should all be provided on each floor of the sleeping apartments with the means of escape, in the event of the lower apartments taking fire during the night. Especial provision to be made for women and children.

"6. Fireworks, powder-works, and chemical manufactories require special precautions.

"7. Persons falling asleep near the fire, or near lights, (*a*) in a state of intoxication, or (*b*) in fits, are frequently burnt to death.

"8. Young children drink scalding water out of the spout of the tea kettle, or fall into scalding water. This happens often in the lower classes, when the mother is out at work, and the young children are left at home alone. The means of obviating this danger are evident.

"9. Special arrangements are, it is scarcely necessary to add, required for preventing the explosions of mines or of steam engines."

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 197) *and "Index of certain Towns"* (page 207).

A

INDEX OF SUB-DISTRICTS.

In this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G as "Grinstead, East;" St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to the order in which it appears in the arrangement of the Districts in the Tables of Abstracts; thus, Abbey Holme (569; 2) is the 2d Sub-District of the Wigton District, No. 569.]

Sub-District.	District.	No.
A		
Abbey	Bath	326; 3
Abbey Holme	Wigton	569; 2

Abstract of Births Registered in Scotland, pursuant to the Act 17° and 18° Vict., c. 80, during each Month of the Year 1864, - - - - - - 5

Abstract of Deaths Registered in Scotland, during each Month of the Year 1864, - 6

Abstract of Marriages Registered in Scotland, during each Month of the Year 1864, - 7

Table showing the Estimated Population in 1864, also the number of Births, Deaths, and Marriages in Scotland, and in its Town and Country Districts in 1864, and the proportion of each of these events to the Population. Also the number of Illegitimate Births and their proportion to the Total Births, - - - 8

REPORT.

TO THE

RIGHT HON$^{BLE.}$ SIR GEORGE GREY, BART., M.P.,

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, *8th February* 1865.

SIR,

IN conformity with the Seventh Section of the Scottish Registration Act (17° & 18° VICT. c. 80), I have the honour to submit to you a General Abstract of the Births, Deaths, and Marriages Registered in Scotland during the year 1864, in order that the same may be laid before Parliament.

As in last Report, a Table is appended shewing the Number of the Births, Deaths, and Marriages, in the Town and Rural Districts of Scotland, and the proportion of these events to the estimated population.

You are aware that, in the month of October last, I suggested that it would be desirable to postpone any Return regarding the working of the Scottish Vaccination Act (26° & 27° VICT. c. 108) —which, in terms of the Nineteenth Section of that Statute, ought to have been included in this Report—until the end of the current year. I mentioned that, by the Act in question, parents are only

bound to cause their children to be vaccinated *within six months* after their birth; and, accordingly, any statement relative to Vaccination at the end of the present year would necessarily be very imperfect. As you are already aware, our Birth Registers (in which the particulars relative to Vaccination are recorded) are annually closed on the 31st of December; and it appears to me desirable that the Vaccination Return should apply, like the Annual Abstract of Births, Deaths, and Marriages, to a full and entire year. In accordance with this suggestion, my first Return relative to Vaccination would apply to the year ending December 31st, 1864, and would be transmitted in the beginning of the year 1866, along with the General Abstract of Births, Deaths, and Marriages registered during 1865.

In your reply to my proposal you intimated your approval of the postponement which I suggested, and the Return will, therefore, be embraced in my Annual Report for 1865. I am happy, however, to state that, from the information which has reached me, I believe the Act is working well, and that the Report at the close of the current year will show a large per centage of cases in which Vaccination has been successfully performed.

I have the honour to be,

Sir,

Your faithful Servant,

W. P. DUNDAS,

Registrar-General.

1864. ABSTRACT OF BIRTHS Registered in Scotland, during each Month of the Year 1864.

SEVENTH

DETAILED ANNUAL REPORT

OF THE

PALL MALL

REGISTRAR-GENERAL

OF

BIRTHS, DEATHS, AND MARRIAGES

IN SCOTLAND.

Presented to both Houses of Parliament by Command of Her Majesty.

EDINBURGH:
PRINTED BY MURRAY AND GIBB,
FOR HER MAJESTY'S STATIONERY OFFICE.

1865.

REPORT.

TO THE

RIGHT HON$^{BLE.}$ SIR GEORGE GREY, BART., M.P.,

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, *April* 3, 1865.

SIR,

I HAVE the honour to submit to you my Detailed Annual Report for the year 1861.

It was during that year that the great war now going on between the Federal and Confederate States of North America commenced,—a war which to no small extent deranged our commerce, and, by stopping the supplies of raw cotton, threw idle immense numbers of the manufacturing population, and those dependent on them.

The year was also one with peculiar features in its meteorological phenomena in so far as Scotland was concerned, as it was the wettest of which we have certain records. The fall of rain greatly exceeded that of previous years, the sky was almost continually dripping, the moisture of the air was greater than usual; while on the Continent of Europe, to the south of the latitude of Great Britain, extreme drought prevailed—drought which even partially affected England.

Notwithstanding these apparently adverse influences, the Births were above their usual proportion, the Deaths were below the average, while the Marriages very nearly attained the average of former years.

I would desire to direct your attention to an inquiry made for the first time into the comparative mortality of the married and the unmarried women at each quinquennial period of life. The results arrived at are startling; and particularly merit the consideration of those engaged in Life Assurance.

A few remarks have been hazarded as to the bearings which these vital statistics appear to have on the question of the contagion of the Epidemic Diseases. They seem to afford a possible explanation of the conflicting evidence which has been given by even the highest authorities as to whether Epidemic Diseases are contagious or not.

The Tables printed in this Report generally correspond with those of former years; an additional Table has, however, been added to show the connection which exists between the proportion of legitimate Births and of married women in each County; and another to show the comparative mortality of married and unmarried women at each quinquennial period of life.

The state of elementary education, as exhibited in the proportion of men and women able to sign their names in the Marriage Register, continues satisfactory, seeing that 89·39 per cent. of the men, and 78·67 per cent. of the women who married in Scotland in 1861 were able to sign their names. Year after year, it appears that as many women are able to sign their names in the Marriage Register in Scotland as men in England.

I have the honour to be,

Sir,

Your faithful Servant,

W. P. DUNDAS,

Registrar-General.

REPORT TO THE REGISTRAR-GENERAL.

SIR,

THE year 1861, to which this Report refers, was one of checkered commercial prosperity, the depression during the latter half of the year being caused by the war in the States of North America. On the 9th of February of that year certain of the Southern States declared their independence of the Union, and adopted a Constitution under the name of the Confederate States. The depression of trade thereby induced, combined, perhaps, with the higher price of provisions, led to fewer Marriages being contracted in Scotland during the year, so that they fell below the average of former years. The price of provisions, which had been rising during 1860, continued to increase during 1861, so that the four pound loaf was nearly twopence dearer in 1861 than it had been in 1860. The demand for labour, however, was, on the whole, good, while wages were high. The Births attained a higher rate than during the previous year, but not so high as during the year 1859, while the Deaths were considerably below those of the previous year, and nearly the mean rate for Scotland. Pauperism, however, increased, and emigration diminished.

On the 8th of April the Census of the population was taken, when it appeared that the total population of Scotland, including the army in Scotland, the navy in Scottish harbours or firths, and the mercantile navy in Scottish harbours or waters, amounted to 3,062,294 persons, of whom

TABLE I.—Population estimated to the middle of each year; with the Number of BIRTHS, DEATHS, and MARRIAGES registered in Scotland during each year, 1855 to 1861; and their Proportion to the Population; showing also the excess of Births over Deaths.

YEAR.	Estimated Population.	Births.	Deaths.	Marriages.	Excess of Births over Deaths.	Proportion to every 100 Persons living.		
						Births.	Deaths.	Marriages.
1855	2,962,500	93,349	62,004	19,680	31,345	3·151	2·093	0·664
1856	2,979,855	101,821	58,529	20,740	42,291	3·417	1·964	0·696
1857	2,997,210	103,415	61,906	21,369	41,509	3·450	2·065	0·713
1858	3,014,565	104,018	63,539	19,655	40,479	3·455	2·107	0·652
1859	3,031,921	106,543	61,714	21,201	44,829	3·514	2·035	0·699
1860	3,049,277	105,629	68,170	21,225	37,459	3·464	2·235	0·695
1861	3,066,633	107,009	62,341	20,896	44,668	3·484	2·032	0·681

1,449,848 were males, and 1,612,446 females. These numbers, if brought to the middle of the year, in order to render them strictly comparable with the Births and Deaths, would be raised to 3,066,633 persons of both sexes, consisting of 1,451,707 males, and 1,614,926 females. These distributed among the Three Great Groups into which we divide the population would furnish 160,589 persons for the Insular Districts, 1,764,705 persons for the Mainland-Rural Districts, and 1,141,339 persons for the Town Districts. (See Table III.)

BIRTHS.

107,009 Births were registered in Scotland during the year 1861, indicating a proportion of 348 Births to every 10,000 persons of the population, estimated to the middle of the year. With a single exception, this is the highest proportion of Births which has been registered in Scotland during any year since the Registration Act came into operation, the Births in 1859 alone exceeding it, when the proportion rose to 351 Births to every 10,000 persons of the estimated population. (See Table I.)

By comparing the proportion of Births in the several Divisions and Counties of Scotland for the years 1859, 1860, and 1861 (see Table V. in

TABLE II.—Proportion of Births, Deaths, and Marriages in every 100 Persons living in the Insular, Mainland-Rural, and Town Districts of Scotland during the years 1855, 1856, 1857, 1858, 1859, 1860, and 1861.—The Population being estimated to the middle of each year.

Years.	Insular Districts.			Mainland Districts.			Town Districts.		
	Births.	Deaths.	Marriages.	Births.	Deaths.	Marriages.	Births.	Deaths.	Marriages.
1855	2·275	1·641	0·441	3·078	1·782	0·580	3·403	2·668	0·834
1856	2·643	1·325	0·514	3·204	1·661	0·599	3·783	2·554	0·869
1857	2·738	1·415	0·585	3·301	1·743	0·628	3·794	2·667	0·866
1858	2·822	1·464	0·544	3·299	1·804	0·576	3·790	2·682	0·787

Scotland .	1,375,479	1,513,263	2,888,742	1,449,848	1,612,446	3,062,294	1,451,707	1,614,926	3,066,633

the Detailed Report for 1860, and Table V. in this Report), it will be seen that the proportion of Births to the population of each of these Divisions and Counties, though differing greatly from each other, fluctuates very little from year to year in each County or Division. This circumstance proves, as was attempted to be shown in last Report, that the cause which determines the proportion of Births to the population is a fixed cause; and when that cause was investigated, the proportion of Births in every County and Division was found to correspond with the proportion of Married women in the population of each County and Division.

To illustrate this interesting point, which throws great light on several important questions in vital statistics, Table VI. has been drawn up, showing the mean annual number of legitimate Births in the several Divisions and Counties of Scotland for the years 1859, 1860, and 1861, their per-centage to the population in each of these Divisions and Counties, and, with a view to their comparison with the proportion of Married women in each of these, two columns have been added as to the proportion of Wives; the first of these showing the proportion of Wives in every 100 females above 15 years of age, the other showing the proportion of Wives among the women at the child-bearing ages, viz., from 15 to 45 years of age. It was necessary to confine this Table to the legitimate children alone, inasmuch as, had the illegitimate children been included, it would have vitiated the results, as some of the Counties which have the smallest number of legitimate children, and the smallest proportion of Wives, have also the largest proportion of illegitimate Births.

By this Table it is seen that the Counties which have the highest proportion of legitimate Births are also those which have the highest proportion of women in the Married state, while those which have the smallest proportion of legitimate Births have also the lowest proportion of Married women.

For instance, in the Northern Division for Scotland, for every 100 persons in the population, only 2·5 legitimate Births occurred, but then only 32·8 in every 100 women between the ages of 15 and 45 were Wives. In the South-Western Division, on the other hand, for every 100 persons in the population, 3·7 legitimate Births occurred, and to correspond with this high proportion of Births, 46·4 of every 100 women between the ages of 15 and 45 were Wives.

TABLE IV.—Number of BIRTHS, DEATHS, and MARRIAGES registered in Scotland, and in its Three Great Groups of Districts, in 1861, and their proportion to the Estimated Population; also the Number of the Illegitimate Births, and their proportion to the Total Births.

1861. Districts.	Births.		Illegitimate Births.		Deaths.						Marriages.	
					No. of Deaths.			Per Cent. to Pop.				
	No.	Per cent. to Pop.	No.	Per cent. to Total Births	Males.	Fem.	Both Sexes.	Males.	Fem.	Both Sexes.	No.	Per cent. to Pop.
Insular .	4,499	2·801	227	5·0	1,235	1,327	2,562	1·684	1·520	1·595	919	0·572
Mainland -Rural	58,191	3·297	5,646	9·7	15,329	15,485	30,814	1·803	1·692	1·746	10,288	0·582
Town .	44,319	3·883	4,056	9·1	14,326	14,639	28,965	2·710	2·387	2·537	9,689	0·848
SCOTLAND	107,009	3·484	9,929	9·28	30,890	31,451	62,341	2·127	1·947	2·032	20,896	0·681

The same fact is manifested if the Counties be taken separately. Thus, in Inverness, for every 100 persons of the estimated population, only 2·5 legitimate Births occurred, and corresponding with this low proportion of Births only 33 in every 100 women between the ages of 15 and 45 were in the Married state, or were Wives. In Linlithgow, on the other hand, for every 100 persons of the population, the very high proportion of 3·8 legiti-

must also be few; but where the proportion of Married women is high, the proportion of legitimate Births must also be high. Hence it happens, that wherever the proportion of Married women is high, the proportion of children and young persons (under 20 years of age) is greater than in a population where a small proportion of the women are in the Married state. This is the true reason why in newly settled states, as in the United States of America and in Canada, the proportion of children and of Births under 20 years of age exceeds the number of the adults; while in old settled states, as those of Europe, the number of the adults (above 20 years of age) exceeds that of the children and young persons under that age.

The proportion of Births to the population was different in the Three Great Groups of Districts into which Scotland has been divided. Thus, in the Insular Districts, for every 1000 persons of the estimated population, only 28 Births occurred; in the Mainland-Rural Districts, 32; but in the Town Districts 38 Births in every 1000 persons. (Tables II. and IV.)

Of the 107,009 Births, 97,080 were legitimate, and 9929 illegitimate, indicating that 9·28 per cent. of the Births were illegitimate. This is a slightly higher proportion of illegitimate Births than during the previous year, when 9·21 per cent. of the Births were illegitimate, and would seem to indicate that illegitimacy is on the increase.

As in former years, so in 1861, it would appear that the proportion of illegitimate Births was highest in the Mainland-Rural Districts, lower in the Town Districts, and lowest in the Insular Districts. Thus, in the Mainland-Rural Districts 9·7 per cent. of the Births were illegitimate; in the Town Districts 9·1 per cent.; but in the Insular Districts only 5 per cent. of the Births were illegitimate. (See Tables IV., VII., and VIII.)

The several Divisions and Counties of Scotland exhibit the greatest possible difference with regard to the prevalence of illegitimacy among the respective populations; and as the proportions for each Division or County are much the same from year to year, the proportions for any one year give a good general idea of the morality of the inhabitants of the several Counties, in so far as illegitimacy is concerned. The last column of Table IX. shows the per-centage of the illegitimate to the total Births in the different Divisions, Groups of Districts, and Counties of Scotland. On consulting that Table it will be seen that the Northern and North-Western Divisions of Scotland, which include the Counties of Shetland, Orkney, Caithness, Sutherland, Ross and Cromarty, and Inverness, only yielded 5·4 per cent. of the Births as illegitimate; while the North-Eastern and the Southern Divisions of Scotland, embracing the Counties of Nairn, Elgin, Banff, Aberdeen, Kincardine, Roxburgh, Dumfries, Kirkcudbright, and Wigtown, had no less than 14 per cent. of the Births illegitimate. Even the South-Western Division of Scotland, which contains the great manufacturing and mining Counties of Renfrew, Ayr, and Lanark, furnished only 7·9 per cent. of the Births as illegitimate, or little more than half the proportion of the North-Eastern and the Southern Divisions.

Of the 107,009 children born during the year, 54,606 were males, and 52,403 females, being in the proportion of 104·2 males for every 100 females at birth. The proportion of the sexes in the legitimate and illegitimate children was, however, very different. Of the legitimate Births there were 103·7 males to every 100 females; but of the illegitimate Births there was the very high proportion of 108·5 males for every 100 females. Taking the seven years' average, viz., 1855 to 1861 inclusive, the same general fact was

evidenced, viz., that the proportion of males among the illegitimate Births exceeded that among the legitimate Births. Thus, the average of the seven years' Births in Scotland shows that among the legitimate Births there were born 105·2 males for every 100 females, while among the illegitimate Births there were 107·3 males for every 100 females.

The result of the seven years' registration of Births in Scotland (1855 to 1861 inclusive) would seem to indicate that the proportion of males to females at birth was rather less in the Town than in the Rural Districts, and lower in both of these than in the Insular Districts. Thus, the seven years' registration of Births shows that in the Town Districts there were annually born 105·1 males for every 100 females; in the Mainland-Rural Districts 105·5 males for every 100 females; but in the Insular Districts 106·6 males for every 100 females. This proportion would not be materially affected though confined to the legitimate Births alone, seeing that the seven years' average of the legitimate Births yields the proportion of 105 males to every 100 females in the Town Districts; 105·4 males to every 100 females in the Mainland-Rural Districts; and 106·4 males to every 100 females in the Insular Districts. These facts, therefore, would seem to indicate that the proportion of males to females at birth is greatest in the populations which are the healthiest, and that the causes which weaken the

and 18 cases of Triplets, indicating the proportion of one Twin Birth in every 85 Births, and one Triplet Birth in every 5845 Births.

The influence of season on the Births is pretty distinctly marked, the largest number of Births occurring during the months of April, May, and June, the period of the year when most of the lower animals bring forth their young, and the smallest number during the months of January and September. Thus it is seen by Table XXXVII. that the greatest number of Births occurred in May, viz., 328 daily, while the smallest number occurred in January and September, viz., 275 Births daily.

As the Births amounted to 107,009, and the Deaths to 62,341, the excess of Births over Deaths amounted to 44,668; and by that number the population of Scotland would have been augmented during the year, had no other causes been in operation to diminish it. The Emigration Commissioners, however, ascertained that 91,770 persons emigrated from the ports of Great Britain and Ireland during the year 1861, of whom 6730 were ascertained to be of Scottish origin. If to that number 2244 be added as the proportion of persons whose origin was not ascertained, the total Scottish emigrants would amount to 8974, which number deducted from the excess of Births over Deaths would make it appear as if the population of Scotland had increased during the year by 35,694 persons. By the Population Returns, however, it appears that the actual increase was little more than half of that; so that a very wide margin must be allowed for migration to England, Ireland, and the Continent of Europe, and for drafts to the Army, Royal Navy, and merchant shipping.

MARRIAGES.

20,896 Marriages were registered in Scotland during the year 1861; being in the proportion of 681 Marriages in every 100,000 of the population, or somewhat under the average annual Marriage-rate of the six previous years. It thus appears that the annual Marriage-rate in Scotland is far below that of England; for taking the seven years, 1855 to 1861 inclusive, Marriages occur in England at the annual average rate of 827 Marriages in every 100,000 of the population, but in Scotland, during the same years, only at the low rate of 686 Marriages in a like population.

TABLE X.—MARRIAGES, 1861. Number of Marriages contracted according to the Rites of the several Religious Denominations, and their several Proportions to the Total Marriages.

Religious Denominations.	SCOTLAND.	Per Centage to Total Marriages.	Insular Districts.	Mainland-Rural Districts.	Town Districts.
Established Church	9332	44·66	437	5452	3443
Free Church	4969	23·78	317	2458	2194
United Presbyterian Church	2925	13·99	79	1390	1456
Roman Catholic Church	1806	8·65	43	477	1286

Other Denominations	1290	6·18	36	281	973
Denomination not stated	188	0·90	6	106	76

In former Reports it was endeavoured to be shown that the low Marriage-rate in Scotland was apparently produced by the young men finding greater difficulty in procuring employment than in England; and that subject was further illustrated by the very different Marriage-rate which prevails in the Insular, the Mainland-Rural, and the Town Districts. The same illustrative facts were observed during the year 1861. Thus, in the Insular Districts, where the population is falling off, Marriages only occurred at the rate of 57 Marriages in every 10,000 persons of the population. In the Mainland-Rural Districts, where the increase of the population is very slow, and where the Marriages do little more than supply the vacancies caused by Death, only 58 Marriages occurred in every 10,000 persons; but in the Town Districts, where the increase of the population is great, where there is a demand for labour, and work is more easily procured, Marriages occurred in the proportion of 84 in every 10,000 persons.

But the low Marriage-rate which prevails in Scotland is not followed, as might be expected, by a low Birth-rate; so that, in so far as increase of the population by Births is concerned, no evil seems to result to Scotland from the low proportion of Marriages; inasmuch as nature seems to compensate for the smaller number of Marriages, by making these Marriages more fruitful. Thus, in 1861, for every Marriage which occurred in Scotland there were born 4·64 legitimate children; that is to say, 464 legitimate children were born to every 100 Marriages. During the same year, however, in England, only 3·89 legitimate children were born to every Marriage, or 389 legitimate children to every 100 Marriages.

The same result is arrived at by another and more exact mode of calculation. In 1861, when the Census was taken in England, the number of wives at the child-bearing ages, viz., 15 to 45, was 2,319,649; and as the number of legitimate children born during the year amounted to 652,249, this gives the proportion of one legitimate child for every 3·55

All Ages	20,896	20,896	919	919	10,288	10,288	9689	9689

wives at the ages 15 to 45 in the population; or, in other words, every 355 wives in England, at these ages, gave birth to 100 children during the year.

In Scotland, during the same year, there were 305,524 wives between the ages of 15 and 45 years; and as 97,080 legitimate children were born during the year, this gives the proportion of one legitimate child for every 3·14 wives at these ages in the population; or, in other words, every 314 wives in the population of Scotland, at these ages, gave birth to 100 legitimate children during the year.

By both these modes of estimation, therefore, it appears that the married women of Scotland are more prolific than those of England, seeing that during the year 1861, every 314 wives at the child-bearing ages gave birth to 100 children in Scotland; whereas it required 355 wives at the same ages for every 100 Births in England. As like results appear year after year, it may be assumed as proved that the Scottish married female is more prolific than the English married female; so that the lower proportion of Marriages in Scotland is quite compensated for by the greater fecundity of the wives.

During the year 1861, of the 20,896 Marriages, 9332 were celebrated according to the rites of the Established Church, 4969 according to those of the Free Church, 2925 according to those of the United Presbyterian Church, 1806 according to those of the Roman Catholic Church, 386 according to those of the Episcopal Church, 1290 according to the rites of the small religious denominations; while in 163 cases the denomination was not stated, and in 25 instances the Marriage was irregular. These numbers yield proportions very similar to those of former years, and indicate approximatively the proportions of the population attached to each religious denomination. This arises from the almost universal custom of having the marriage ceremony performed by the minister of the denomination to which the bride belongs. By Table X. it will be seen that 44·66 per cent. of the Marriages were celebrated by ministers of the Established Church, 23·78 per cent. by those of the Free Church, 13·99 per cent. by those of the United Presbyterian Church, 8·65 per cent. by those of the Roman Catholic Church, 1·84 per cent. by those of the Episcopalian Church, 6·18 per cent. by ministers and others of the smaller religious denominations; while in 0·90 per cent. the religious denomination was not stated.

TABLE XII.—MARRIAGES, 1861. Number and Proportion of Men and Women, under 21 years of Age, who contracted Marriage in England and in Scotland, and in the Insular, the Mainland-Rural, and Town Districts of Scotland, in 1861.

	Number Married in 1861, whose Ages were ascertained.		Number under 21 years.		Per centage under 21 years.	
	Men.	Women.	Men.	Women.	Men.	Women.
ENGLAND . .	103,694	103,694	9,043	25,146	8·720	24·250
SCOTLAND . .	20,873	20,836	1,480	4,403	7·090	21·132
Insular Districts .	917	916	22	106	2·399	11·572
Mainland-Rural Districts . .	10,271	10,248	703	2,102	6·834	20·511
Town Districts .	9,685	9,672	755	2,195	7·795	22·694

Of the 20,896 men who married during 1861, the ages of 20,873 were ascertained; and of that number 1480 were under 21 years of age. Of the 20,896 women who married during the same year, the ages of 20,836 were ascertained; and of that number 4403 were under 21 years of age. It thus appears that 7·09 per cent. of the men, and 21·13 per cent. of the women who married during 1861, were under the legal age of 21 years, or were minors.

This is under the proportion of minors who marry in England. Thus, during the same year, 163,706 Marriages were registered in England; but in only 103,694 cases were the ages of both parties ascertained. Of that latter number 9043 men, and 25,146 women were ascertained to be under 21 years of age; thus demonstrating that 8·72 per cent. of the men, and 24·25 per cent. of the women who married during the year in England were under 21 years of age, or were minors. See Table XII.

As might be expected, the proportion of minors who marry in the Town Districts is greater than that of those who marry in the Mainland-Rural or the Insular Districts. Thus, in the Insular Districts, only 2·39 per cent. of the men, and 11·57 of the women who married in 1861, were under 21 years of age. In the Mainland-Rural Districts 6·83 per cent. of the men, and 20·51 per cent. of the women who married were under 21 years of age. But, in the Town Districts, 7·79 per cent. of the men, and 22·69 per cent. of the women who married were under 21 years of age.

These facts lead to the same conclusion as the general proportion of Marriages in the several Counties or Districts, viz., that the comparative facilities of procuring a livelihood influence both the number of Marriages in the general population, and the comparative earliness at which the Marriage may be contracted. Thus it is seen that in England, not only are Marriages contracted in much greater proportions than in Scotland, but more of these Marriages are at an earlier age. And the same is seen in the several Districts and Divisions of Scotland itself, the observed difference depending on the same cause, viz., the comparative facility of procuring a livelihood. Tables XIII. and XIV. illustrate this in a very striking manner, by showing the number and proportion of men and women who contracted Marriage in England, in Scotland, and in the several great groups of Districts and Divisions of Scotland, during 1861. Thus, in England, while 49·59 per cent. of the men who married were under 25 years of age, only

---

TABLE XIII.—MARRIAGES, 1861. Number and Proportion of Men and Women, under and above 25 years of Age, who contracted Marriage in England and in Scotland, and in the Insular, Mainland-Rural, and Town Districts of Scotland, in 1861.

	Number who Married.				Per centage who Married.			
	Under 25 years.		Above 25 years.		Under 25 years.		Above 25 years.	
	Men.	Women.	Men.	Women.	Men.	Women.	Men.	Women.
ENGLAND . . .	51,426	64,775	52,268	38,919	49·593	62·466	50·407	37·534
SCOTLAND . . .	8,550	12,235	12,323	8,601	40·962	58·720	59·038	41·280
Insular Districts . .	219	419	698	497	23·882	45·742	76·118	54·258
Mainland-Rural Dists.	4,178	5,947	6,093	4,301	40·677	58·030	59·323	41·970
Town Districts . . .	4,153	5,869	5,532	3,803	42·777	60·680	57·223	39·320

40·96 per cent. were under that age in Scotland; and while 62·46 per cent. of the women who married in England were under 25 years of age, only 58·72 per cent. were under that age in Scotland. People are therefore somewhat older in Scotland when they contract Marriage than they are in England, in consequence of the difficulty of procuring a livelihood being greater in Scotland, and thus causing Marriage to be deferred till a later period of life. To what extent the postponement of Marriage may affect the question of illegitimacy we have at present no means of ascertaining.

But the different Divisions of Scotland exhibit such facts even more strikingly than Scotland and England. Thus, in the North-Western Division, where room for new families is only procured by the death of the old, only 21·10 per cent. of the men, and 49·41 per cent. of the women who married were under 25 years of age. In the Northern Division, where much the same state of matters prevails, only 30·17 per cent. of the men, and 42·75 per cent. of the women who married were under 25 years of age. But in the South-Western Division, where the demand for labour is great from the prosperity of mining and manufactures, no less than 46·100 per cent. of the men, and 64·43 per cent. of the women who married were under 25 years.

These striking facts, then, seem to prove what are the restraints on Marriage in this country. They also prove that these restraints press more heavily on the population of Scotland than on that of England; and thus account for the much larger proportional emigration from Scotland than from England.

To complete the series of Tables given in former Reports, Table XV. is appended, which shows the same facts as the above, but from a different point of view, viz., by comparing the number of Marriages in each Division with the population, and also by comparing the number of men who marry in each Division of Scotland, above and under 25 years of age, with the male population in each Division. By that Table it is seen that in every 10,000 males in each Division of Scotland, only 24 under 25 years of age married in the North-Western Division, 34 in the Northern, 42 in the West-Midland, 48 in the Southern, 50 in the North-Eastern, 61 in the East-Midland, 64 in the South-Eastern, but 73 in the South-Western Division.

TABLE XIV.—MARRIAGES, 1861. Number and Proportion of Men and Women, under and above 25 years of Age, who contracted Marriage in Scotland, and in its Eight Divisions, in 1861.

DIVISIONS.	Number of Persons Married whose Ages were ascertained.		Number of Persons Married.				Per Centage to the total Men and Women who Married.

8. Southern	1,253	1,252	492	692	761	560	40·861	55·271	59·138	44·729
SCOTLAND	20,873	20,836	8,550	12,235	12,323	8,601	40·962	58·720	59·038	41·280

Of the 20,896 Marriages contracted in Scotland during the year 1861, the conjugal condition of the parties previous to their entrance into the new engagement was ascertained in 20,157 cases. Of these 20,157 Marriages, 17,431 were between bachelors and spinsters, 441 between bachelors and widows, 1768 between widowers and spinsters, and 517 between widowers and widows. These numbers indicate that in every 100 Marriages 86·48 were between bachelors and spinsters, 2·19 were between bachelors and widows, 8·77 were between widowers and spinsters, and 2·56 were between widowers and widows. Table XVI. shows these facts for Scotland, and also for the Insular, the Mainland-Rural, and the Town Districts; and by that Table it will be seen that a very much larger proportion of widowers and of widows re-enter the married state in the Town Districts, than in either the Insular or the Mainland-Rural Districts. This fact is even more distinctly brought out by the last two columns of Table XVII., in which are given the proportion of

TABLE XV.—MARRIAGES, 1861. Number of Persons who married in 1861, and their Proportion to the estimated Population. Also the number of Males under and above 25 years of Age who married in 1861, and their Proportion to the estimated number of Males in Scotland and in its Eight Divisions (the Ages not specified being included).

The proportion of persons who re-marry in Scotland is smaller than in England. Thus, while in Scotland 11·33 in every 100 of the men who married in 1861 were widowers, 13·18 in every 100 were widowers in England during the same year. And while only 4·75 in every 100 women who married in Scotland were widows, 8·80 in every 100 women who married were widows in England.

The comparative state of Elementary Education among the population may be estimated by ascertaining what proportion of the men and of the women who married could sign their names in the Marriage Registers.

During the year 1861, of the 20,896 men who married, 18,679 signed their names in full in the Marriage Registers, and 2217 signed by mark. Of the 20,896 women who married, 16,439 signed their names in full, while 4457 signed by mark. These numbers show that 89·39 per cent. of the men, and 78·67 per cent. of the women who married during the year were able to sign their names in full; while 10·60 per cent. of the men, and 21·33 per cent. of the women were obliged to sign by mark. This is a very much larger proportion of both men and women able to write their names than in England; for in the same year only 75·4 per cent. of the men, and 65·3 per cent. of the women could sign their names by writing in the Marriage Registers of England. It would appear, therefore, that more women can write in Scotland than men in England, and it is the same year after year.

Table XVIII. shows the varying proportions in which men and women could sign their names by writing or by mark in the Marriage Registers of the several Counties, Divisions, and groups of Districts in Scotland; and shows the fact, that a higher proportion both of men and of women can sign their names in writing in the Rural parts of Scotland, than in the Town Districts. Thus, in the Mainland-Rural Districts of Scotland, 92·45 per cent. of the men, and 84·14 per cent. of the women could write their names in full; while in the Town Districts only 87·75 per cent. of the men, and 72·07 per cent. of the women could write their names.

The facts brought to light by Table XVIII. merit the attention of those who devote attention to the education of the people, as they show in what Counties elementary education is most backward. In so far as the test under consideration enables us to judge, the Counties of Ross, Cromarty, and Inverness seem to be in the most backward state as to elementary education, seeing that 31·88 per cent. of the men in Inverness, and 42·72 per cent. in Ross and Cromarty were obliged to sign their names by mark; while, to correspond with this, 52·71 per cent. of the women in Inverness, and 61·03 per cent. in Ross and Cromarty signed by mark. In some Counties and Towns, the large number of Irish in the population increases the proportion of persons who sign by mark. This is notably the case in the Counties of Dumbarton, Renfrew, Lanark, and Wigtown; and is the main cause why the population of Glasgow furnishes upwards of 15 per cent. of males unable to write, while the proportion of men in Edinburgh unable to write is only 4 per cent.

In a very few instances the Registrars note some of the more remarkable facts which come under their observation, and it is to be regretted that such facts are not more frequently recorded by them. Thus one remarks that a woman who was married in 1828 had her first child in 1861, after having been 33 years married. Another states that a labourer, by two successive wives, had 23 lawful children.

DEATHS.

62,341 Deaths were registered in Scotland during the year 1861, being in the proportion of 203 Deaths in every 10,000 of the population. This was a lower Death-rate than the mean of the six previous years, which, in consequence of the great mortality which prevailed during 1860, reached the high mean of 208 Deaths annually in every 10,000 persons. A year of low mortality often follows one in which the mortality has been excessive; as if all the weaker members of the community had been cut off during the year of high mortality, and those who remained were the more able to resist the causes of Death during the year which followed.

The above mortality, however, was much below the Death-rate of England for the same year, which was in the proportion of 216 Deaths in every 10,000 of the population, the average annual mortality of the six previous years having been 219 Deaths in every 10,000 persons. Both in England and in Scotland, therefore, the year 1861 was one in which the mortality was lower than usual.

It is now an established fact that the inhabitants of the Insular and Mainland-Rural Districts are more healthy, and die at a much lower rate, than the inhabitants of the Town Districts. Thus, in 1861, while the inhabitants of the Insular Districts were only cut off at the rate of 159 Deaths in every 10,000 persons, and those of the Mainland-Rural Districts at the rate of 174 Deaths in the same population, the inhabitants of the Town Districts suffered at the rate of 253 Deaths in every 10,000 persons.

The mortality in the Eight Principal Towns of Scotland varied considerably during 1861, being highest in Glasgow and lowest in Leith. Thus, in every 10,000 persons in each of these Eight Towns, 212 died in Leith during the year, 240 in Aberdeen, 244 in Edinburgh, 252 in Greenock, 254 in Paisley, 260 in Dundee, 262 in Perth, and 275 in Glasgow. Table XIX. shows the mortality which prevailed in each of these Towns during the seven years 1855 to 1861 inclusive. From that Table it appears, that in every 10,000 persons living in each of these Towns, 223 died annually in Leith, 239 in Aberdeen, 242 in Edinburgh, 252 in Perth, 267 in Paisley, 270 in Dundee, 296 in Glasgow, and 297 in Greenock. It would thus ap-

pear that, on the average of years, Leith and Aberdeen are the most healthy of these Towns; Greenock and Glasgow the most unhealthy.

Ever since the Registration Act gave us the means of ascertaining the fact, it would appear that in Scotland the mortality of the males is constantly higher than that of the females. Thus, if we take the seven years 1855 to 1861 inclusive, it appears that the male Death-rate was 217 Deaths annually in every 10,000 males, while the female Death-rate was only 198 Deaths in every 10,000 females. During 1861 the proportional Death-rate of the respective sexes closely corresponded with the above, seeing that 212 males died in every 10,000 males, but only 194 females in every 10,000 females.

This higher male mortality occurred at almost every period of life; the only exceptions during 1861 being during the fourth and fifth years of life, from 10 to 15 years of age, and between 30 and 40 years. At these ages, in 1861, the female mortality was very slightly higher than the male. It would appear, however, that if we take a series of years (1855 to 1861), the female mortality is always slightly above that of the male during the third and fifth years of life, and also between 10 and 15 years. But at all other ages the male Death-rate exceeds the female, and strikingly exceeds it during the first year of life, when the two sexes are clothed, fed, and treated in all respects alike.

As it gives a much more just idea of the relative mortality of the sexes to take a series of years, Table XX. is drawn up to show the mean annual mortality of males and females in Scotland at each period of life during the seven years 1855 to 1861 inclusive. By that Table it appears that during the first year of life 14·955 male children die annually out of every 100 male children living, while only 12·467 female children die annually out of every 100 female children. This striking fact proves that when the sexes are treated in everything alike, the tendency to death in the male at that period of life exceeds that of the female as 15 exceeds 12½. This greater tendency to death in the male continues to exhibit itself during the fourth year of life; but during the second, the third, and the fifth years of life the female mortality slightly exceeds the male. From the fifth to the thirtieth year of life the mortality or Death-rate of the inhabitants of Scotland remains considerably below one per cent.; but both with males and females the most healthy period of life, and during which there are fewer Deaths than at any previous or subsequent age, is from the tenth to the fifteenth year of life. In both sexes the annual mortality is below a half of a per

centage of the living at these ages, and during that period the males die in rather smaller proportions than the females.

From the age of 15 the women begin to marry, and it might have been imagined that the superadded dangers of child-birth would, at the child-bearing ages (15–45), have raised the female Death-rate higher than the male. But a seven years' result proves that in Scotland the female Death-rate at these ages is lower than the male Death-rate. Thus, in every 10,000 persons of each sex at each age, only 65 females, but 72 males, die annually between the ages of 15 and 20; 80 females, but 99 males, die annually between the ages of 20 and 30; 100 females, but 106 males, die annually between the ages of 30 and 40; while only 116 females, but 138 males, die annually between the ages of 40 and 50. Thus, at every one of these ages females die in smaller proportions than males.

The same higher Death-rate among the males presents itself till the close of life, so that (with the exception of the second, third, and fifth years of life, and again from the tenth to the fifteenth year) it may safely be said that, as a general rule, the male Death-rate at every period of life is higher in Scotland than the female Death-rate. It must be remembered that each country has its own peculiarity even in this respect; for in some of the Continental States, though the male Death-rate is higher than that of the female during the earlier years of existence, the female Death-rate exceeds that of the male during all the active and adult period of life.

But a most important inquiry, and one which from want of facts has not hitherto been investigated, is, What is the effect of Marriage on female

---

* The Populations of this and of the three following Tables are estimated to the middle of the year, and hence do not accord with the numbers taken at the Census on 8th April 1861.

life, both during the period of child-bearing, and after that period of life has passed?

In order to throw light on this interesting subject, Table XXV. has been prepared. That Table gives in the first column the number of Married women (Wives) and Widows living in Scotland at every quinquennial period of life, on the 30th of June 1861; and in the third column, the number of Unmarried women above 15 years of age, also at every quinquennial period of life. It then gives in the second column the Deaths during the year 1861 among the Married and Widowed females; and in the fourth column, the Deaths among the Unmarried women at each age; and, lastly, it gives the per-centage of Deaths among the Married and the Unmarried women living at each age.

The first striking fact which that Table seems to bring to light is, that the general Death-rate among the Married women is very much higher than that among the Unmarried; so that, while only 1240 Unmarried women above 15 years of age died during the year out of every 100,000 Unmarried women, 2109 Married women died out of a like number of Married women. If we trusted, therefore, to these total proportions, we should infer that Married life, taken as a whole, nearly doubled the mortality of the female; for these numbers seem to prove, that in an equal number of Married and Unmarried females, *seven Married* women would die annually for every *four Unmarried.* This would indeed be a fearful difference, and would show in the strongest light the superadded dangers to the female which the Married life brings. But the conclusion would be a mistake, arising from the fact that the difference is caused by the number of

Unmarried women being far greatest at that period of life when the mortality is very low, viz., from 15 to 20 years of life, whereas the number of Married women is greatest at those periods of life when the mortality is high, seeing that the mortality increases with age. Thus the maximum number of Married women is not attained till between the 30th and 35th year of life; whereas the maximum number of Unmarried women is from the 15th to the 20th year of life, at which age the mortality is always a third lower.

But all females above 15 years of age may be divided into two marked groups or divisions: 1st, Females at the ages when they are capable of bearing children, viz., from 15 to 45 years of age; and, 2d, Females past the child-bearing age, viz., from 45 to the close of life. Let us see what light the Table throws on the mortality of the Married and the Unmarried when thus grouped.

When the females above 15 years of age are arranged in these two groups, we arrive at the second striking fact which this Table reveals, viz., that the increased mortality of the Married female is limited to the child-bearing age (15 to 45 years), whereas above that age, the Married female dies at a considerably lower rate than the Unmarried female. Thus, in every 100,000 Married women between the ages of 15 and 45 years, 1003 died during the year; but, in an equal number of Unmarried women, only 821 died during the year. In other words, at the ages 15 to 45 years, in an equal number of Married and of Unmarried women, 10 Married women died for every eight Unmarried women.

But even this mode of estimating the comparative mortality of the

Married and the Unmarried makes that of the Married women to appear greater than it really is, because, as was pointed out with regard to the total proportions, the ages differ so widely at which the greatest number of Married and Unmarried women are met with.

Above the age of 45, however, all is reversed; for in every 100,000 Married women above that age 3495 died during the year; while in an equal number of Unmarried women at the same ages 3691 Deaths occurred. This fact proves, that as soon as the child-bearing age ceases, the life of the Married woman becomes more valuable, and the mortality lower than that of the Unmarried woman at the same age.

These facts then prove that it is child-bearing which is the cause of the high mortality of the Married female at the child-bearing ages; but that as soon as she gets past that period of life, her chances of life are superior to that of the Unmarried female.

It is, however, only by a close and accurate comparison of the mortality of the Married and Unmarried females at every quinquennial period of life, that a true idea of the Death-rates of each can be obtained, and such a comparison is not liable to any fallacy. In a small population like that of Scotland, it is true that the proportions may vary slightly from year to year, but the general results will always correspond, so that every confidence may be put in the results which the Table brings to light.

When the proportional Death-rates at the quinquennial periods of life are compared, it is seen that the high Death-rate of the Married female appears to be confined to the ages under 30 years; but that from 30 to 35, and again from 35 to 40 years, the Death-rate of the Married female falls below that of the Unmarried.

But the striking fact is, that the mortality of the Married females between the ages of 15 and 20 years is higher than that of the Married females even during the next three quinquennial ages; viz., it is higher than the mortality of the Married females at the ages 20 to 25, 25 to 30, and 30 to 35 years. This is very remarkable, seeing that the mortality, as a general rule, increases with age; and the fact brought to light by the Table, that the mortality of the Married woman between 15 and 20 years of age is much greater than at the three immediately higher quinquennial ages, seems to indicate that marrying before the frame has acquired its full development, causes the woman to run greater risk of her life than if Marriage had been delayed till the full growth was completed.

But it is between 15 and 20 years of age that the greatest difference occurs between the mortality of the Married and that of the Unmarried female. Thus, according to the Table, it would appear that in every 100,000 Married women at that age, 983 Deaths occurred; while in an equal number of Unmarried women at the same ages only 691 Deaths occurred. In other words, supposing Married and Unmarried were in equal numbers between 15 and 20 years of age, 10 Married would die for every 7 Unmarried.

At the next quinquennial period of life, viz., between the ages of 20 and 25 years, it appears that in every 100,000 Married women 910 Deaths occurred; while in an equal number of Unmarried women only 783 Deaths took place. In other words, in equal numbers of each class from 20 to 25 years of age, 9 Married women would die for every 8 Unmarried women; so that the difference was much less between the Death-rates of the Married and the Unmarried at that age than at the previous or junior age.

From the 25th to the 30th year of life, the difference in the Death-rates

---

of the Married and the Unmarried is slight, inasmuch as 928 Deaths occurred in every 100,000 Married women, while 903 Deaths occurred in a like number of Unmarried.

From the 30th year of life, the chances appear to be in favour of Married life, inasmuch as the Table shows that between 30 and 35 years of age only 927 Deaths occurred in every 100,000 Married women ; whereas 941 Deaths occurred in a like number of Unmarried women at the same ages.

The same is seen at the next age, viz., from 35 to 40 years of age ; for while only 1116 Deaths occurred among every 100,000 Married women, there were 1181 Deaths in a like number of Unmarried women at the same ages.

It seems to be unnecessary to compare the relative Death-rates of the Married and Unmarried females above this age. Speaking generally, it may be said that at every age above 30 years, the mortality of the Married female is lower than that of the Unmarried, so that the higher mortality of the Married female is confined to the ages under 30 years.

The important question for solution, therefore, is, what is the cause of the mortality of the Married female being so much higher than that of the Unmarried at the three quinquennial ages, 15–20, 20–25, and 25–30 ? To aid us in such an inquiry, some additional facts are required ; and they are so far supplied by Tables which were published for Edinburgh and Glasgow in our Second Detailed Annual Report. From these Tables it appears that in Edinburgh and Glasgow in 1855, of 16,573 mothers, 9274 were under 30 years of age, and 7299 above that age. That is to say, that, speaking in a very general way, nearly as many women above 30 years as under that age bore children in these Towns during 1855. Now it may be assumed

* The Populations of this and of the seven following Tables are all calculated to the middle of the year, and therefore do not correspond with the Census numbers, which are for the 8th of April only.

that the relative proportions of women under and above 30 years of age, who annually bear children in Scotland, are much the same; let us, therefore, apply this knowledge to the solution of the above problem.

If nearly an equal number of women above and under 30 years of age bear children, and if it be found, as Table XXV. proves, that the mortality of the Married female is only greater than that of the Unmarried female below 30 years, while, above that age, fewer Married females die than Unmarried; the conclusion seems irresistible that the greater mortality of the Married female under 30 years of age cannot be owing simply to child-bearing, because it does not increase the mortality of the Married female above 30 years of age. But that Table just as distinctly proves that it is some danger connected with Married life, because the Unmarried females under 30 years of age are not subject to it; and that it is a danger which is greatest during the earlier years of marriage, and which disappears as life advances. Every medical practitioner seeing these facts would at once suggest, as the explanation, that this additional danger during the earlier years of Marriage is the birth of the first child. It is a well-known fact that the risk to the mother is far greater at the birth of her first child, than at any subsequent delivery; and it is extremely probable that the whole extra mortality of the Married female under 30 years of age, over that of the Unmarried at the same ages, may be caused by the greater dangers which attend the delivery of the first child. This can almost be demonstrated to be the true explanation.

If we throw the Tables above referred to, having reference to the ages of the mothers in Edinburgh and Glasgow in 1855, into another form, as here given, they will show us the number of mothers in these Towns at each quinquennial period of life, the numbers who at each age bore their

BOTH SEXES	170,664		4,168		2·442	

first child, and the proportion of mothers bearing their first child to every 100 mothers at each age. We have then the following interesting result:—

Ages of Mothers.	Total Number of Mothers.	Number of Mothers bearing their First Child.	Proportion of Mothers bearing their First Child to every 100 Mothers.
15—20 Years	403	354	87·8
20—25	3,814	1,921	50·3
25—30	5,057	1,019	20·1
30—35	3,943	331	8·3
35—40	2,395	124	5·1
40 & above	961	32	3·3

Between the ages of 15 and 20 years, 87 per cent. of the mothers were confined with their first child. Between the ages of 20 and 25 years, 50 per cent. of the mothers were confined with their first child. Between 25 and 30 years, only 20 per cent. of the mothers were confined with their first child; and the proportion diminished to 8, 5, and 3 per cent. at the three succeeding quinquennial periods of life.

Assuming, therefore, that in all Scotland, the proportion of mothers bearing their first child is at each age the same as in these Towns, and comparing these proportions with those of the Married women who died at each quinquennial period of life, we are almost driven to the conclusion that the excessive mortality in the Married female, as compared with that of the Unmarried at the same ages, is almost solely due to the superadded dangers which attend the birth of the first child. That, in fact, after the birth of her first child, the Married female, even during the rest of her child-bearing life, has an equal chance of life with the Unmarried, and has a better life than the Unmarried after she has passed her 30th year.

In order fully to have investigated this subject, the inquiry ought to have been carried one step further, so as to ascertain positively whether a higher Death-rate does attend the Birth of the first child. But the Schedules now in use in Scotland for the Registration of Births and Deaths, do not furnish us with all the information required for settling this question; so that, in the meantime, we must rest satisfied with the above approximations. Should we ever have spare time, however, it is intended to abstract the required particulars from the Register Books of 1855, which embrace a much greater number of details than those now in use.

During the year 1861, it would appear from Table IV., that in every 10,000 persons living in each of the Three Great Groups of Districts into which Scotland has been divided, 159 persons died in the Insular Districts, 174 in the Mainland-Rural Districts, but 253 in the Town Districts. The mortality in the Town Districts, therefore, very greatly exceeded that in the Rural Districts; and the higher proportion in the Mainland-Rural Districts over that of the Insular, was no doubt caused by their containing numerous Towns with from 2000 to 10,000 inhabitants in each.

The varying Death-rates in each of these Groups or Districts are not casual, but steady, and are reproduced with remarkable regularity year after year. Thus the following Table exhibits the mean annual per-centage of Deaths to the population in each of these Groups of Districts, during the seven years 1855 to 1861 inclusive:—

GROUPS OF DISTRICTS.	Both Sexes.
Insular	1·393
Mainland-Rural	1·763
Town	2·678

But this high mortality in the Town Districts is not confined to any one period of life, but extends over every age, though it is much more remarkable in infants under 5 years of age than at any subsequent period of life. This will be seen if we compare the proportion of Deaths at different ages given in Tables XXIII. and XXIV., which refer to the Mainland-Rural and Town Districts. Thus, of male infants under 1 year, while only 11·5 per cent. died during the year in the Mainland-Rural Districts, 19·1 per cent. died in the Town Districts. Of male infants under 2 years of age, while only 4·3 per cent. died during the year in the Mainland-Rural Districts, 10·9 per cent. died in the Town Districts. Of male infants under 3 years of age, while only 2·3 per cent. died in the Mainland-Rural Districts, 4·8 per cent. died in the Town Districts. Or taking the entire male population under 5 years of age, while only 4·2 per cent. died in the Mainland-Rural Districts, 8·6 per cent., or more than double the proportion, died in the Town Districts.

The same is true of the females. Thus, of the female infants under 1 year of age, only 9·1 per cent. died during the year in the Mainland-Rural Districts, but 15·9 per cent. died in the Town Districts. Of the entire female population under 5 years of age, while only 3·9 per cent. died in the Mainland-Rural Districts, 7·7 per cent. died in the Town Districts.

These facts prove that at every separate year of life under 5 years, and also in the population under 5 years taken as a whole, the mortality which prevails in the Town Districts is almost exactly double that which prevails in the Rural Districts.

At more advanced ages, the difference between the mortality which prevails in the Town and in the Rural Districts, though not so striking

nor so great, still manifests itself at every age of life. Thus, comparing the male columns alone in Tables XXIII. and XXIV., while in every 10,000 males at each age, 72 died in the Mainland-Rural Districts between the ages of 5 and 10 years, 109 died in the Towns at the same ages. While 66 males

between the ages of 15 and 20 died in the Mainland-Rural Districts, 82 died in the Towns. While 84 males between the ages of 30 and 40 died in the Mainland-Rural Districts, 106 died at the same ages in the Town Districts; and so on at every separate age.

From all this it may be safely concluded that human life is greatly shortened by large masses of human beings living together in Towns; and that while a Town's residence increases the Death-rate at all ages, and to both sexes, it doubles it for all children under 5 years of age.

Tables XXVI. to XXXIII. inclusive continue the series of Tables for each of the Eight Principal Towns of Scotland, showing the number and proportion of Deaths at each age of life, distinguishing each year of life under 5 years.

Causes of Death.

Of the 62,341 Deaths in Scotland during the year 1861, the Cause of Death was recorded in 59,417 cases; thus leaving only 2924 cases in which either no Cause of Death was stated, or the entry was made in such indefinite terms that it could not be tabulated under any particular Class of Diseases. Nearly the half of these were children under 1 year of age, who had not the benefit of medical attendance, and most of whose Deaths were registered under the vague title of Bowel-hives.

Class I. *Zymotic Diseases.*

The Zymotic (or Epidemic and Contagious) Class of Diseases cut off 12,406 persons in Scotland during the year 1861, and thus constituted 20·87 per cent. of the Specified Causes of Death. This is the smallest mortality from Zymotic Diseases which has occurred since the Registration Act came into operation in the beginning of 1855, and is 2072 fewer Deaths

from these Diseases than in 1860, and 2234 fewer Deaths from that Class than in 1859. It is rather a singular fact, that the mortality from the Zymotic Class of Diseases increased gradually and regularly from 1855 till it attained a maximum in 1859 and 1860, and then suddenly subsided during 1861 to a lower proportion than during the six previous years, as the following Table shows:—

YEAR.	ZYMOTIC DEATHS.	YEAR.	ZYMOTIC DEATHS.
1855	13,582	1859	14,640
1856	13,779	1860	14,478
1857	14,046	1861	12,406
1858	14,132		

It has been found, when investigating the phenomena of the natural world, that most things have a tendency to return in cycles of longer or shorter periods. The above facts would seem to show that the same is probably true of Disease. When the phenomena of Disease shall be more carefully studied, it will probably be also at the same time found that Diseases spread like waves, gradually creeping over the country, exactly as storms do. This fact has been distinctly traced with regard to Epidemic Cholera, and is probably true, more or less, of all Epidemic Diseases. For instance, the Epidemic Class of Diseases attained their maximum mortality in England in 1858, while in Scotland the maximum was not attained till the following year, as if the Epidemic wave took nearly a year to travel northwards from the South of England to the North of Scotland.

In Non-epidemic years, such as 1861, there is less difference between the comparative Death-rates from that Class of Diseases in the Town and Rural Districts than in Epidemic years; indeed, no greater difference than exists between the Death-rates from all causes in these respective groups of Districts. Thus, in 1861, in every 10,000 persons living in each group of Districts, 344 Deaths from the Zymotic Class of Diseases occurred in the Insular Districts, 351 Deaths in the Mainland-Rural Districts, and 547 Deaths in the Town Districts, which is very much the same proportion as the total Deaths bear to each other in each of these Districts. That this is the case is manifested in a very striking manner by looking at the proportion which the Zymotic Deaths bear to the total Specified Causes of Death in each of these Districts. Thus, in every 10,000 Specified Causes of Death in each of these Districts, 2190 were caused by the Zymotic Class of Diseases in the Insular Districts, 2012 in the Mainland-Rural Districts, and 2156 in the Town Districts. These numbers correspond so closely with each other that they may, for all practical purposes, be regarded as identical. Whether, therefore, the proportion of Deaths by the Zymotic Class of Diseases be compared with the Population, or with the total Specified Deaths, the same conclusion is arrived at, viz., that in a non-Epidemic year the mortality from that Class, as compared with the total Deaths, is absolutely identical in the scattered Rural Population, and in the crowded Town Population.

If these facts are well established, they have most important bearings on the question of Contagion. They seem to prove that the so-called Epidemic Diseases, in non-Epidemic, that is in ordinary years, are not, any more than other Diseases, propagated by contagion; and that if,

in ordinary years, we ascribe to them a contagious nature, we must allow the same to every Disease. This must be apparent from the fact, that in the crowded Town population, where it is quite impossible to prevent contact with the healthy, these Zymotic Diseases are not more prevalent and fatal, as compared with all other Diseases, than they are in the Country Districts. Whereas, did these Diseases spread chiefly, or even to a considerable extent, by contagion, they would always be thrice as proportionably numerous in the Town as in the Rural Districts. Thus, take the Deaths from the Zymotic Class of Diseases in the Insular Districts and compare them with the Deaths in the Towns, and they will be found to be in the exact same proportion as the Deaths from all Diseases in these two Districts.

Total Insular Deaths	are to the	Total Town Deaths	as the	Insular Zymotic Deaths	are to the	Town Zymotic Deaths
1595	:	2537	::	344	::	547

These proportions are the very figures found in Table XXXIV. That fact then appears to demonstrate, that in non-Epidemic years it is impossible to allow that these Diseases propagate or extend to any appreciable extent by contagion. They can alone extend, or be propagated by what we, from the want of a better name, call either Epidemic or Endemic causes —that is to say, that in ordinary years these Zymotic Class of Diseases extend not by the sick communicating the Disease to the healthy, but by the same influences, whatever these be, which induce and propagate all Diseases; as, Bronchitis, Pneumonia, Consumption, Rheumatism, etc.

But while a non-Epidemic year seems to demonstrate that the Zymotic Class of Diseases are non-contagious during such years, the facts brought to light regarding Epidemic years seem, on the other hand, to show just as decidedly that in such years Diseases of the Zymotic Class are largely propagated by contagion. The two years, 1859 and 1860, are examples of Epidemic years in Scotland; notably 1859; so let us adduce it as an illustration of the fact we wish to point out.

If, in 1859, the proportion of Zymotic Deaths in the Insular Districts, as compared with the population, bore the same relation to the Zymotic Deaths in the Town Districts, as the total Deaths in the Insular bore to the total Deaths in the Town Districts, only 460 persons in every 100,000 persons ought to have been cut off by the Zymotic Diseases in the Town Districts in 1859.

1626 : 2526 :: 296 : 460

Instead of 460 Deaths, however, 689 occurred, or a third more than the regular proportion due to a Town's increased mortality.

This fact, which was nearly as strongly shown in 1860 (also, as above shown, an Epidemic year), appears to demonstrate that in Epidemic years, the Zymotic Class of Diseases propagate or spread not only by virtue of their unknown Epidemic or Endemic constitution, but also to a very large extent by means of contagion. Indeed, these facts would seem to prove that when Zymotic Diseases assume the true character of Epidemics, they also at the same time become capable of being propagated by contagion.

Medical observation has to a large extent confirmed the truth of the results which have been deduced from the facts above referred to; for it has been often observed that the Diseases termed Epidemic, of whose propagation by contagion not a trace appears for a considerable period, seem in other years to change their nature, so that they not only spread by reason of their unknown Epidemic agency, whatever that may be, but also to a considerable extent by contagion.

Should the conclusions drawn from the above facts be true, and be corroborated by further research, they would furnish a valuable and stable basis on which the Legislature could found their Quarantine Laws; for

TABLE XXXIV.—DEATHS, 1861. Proportion of Deaths from different Diseases in every hundred thousand persons of the Population, and of either Sex, in Scotland and in its Three Great Groups of Districts, the Insular, the Mainland-Rural, and the Town Districts, during 1861; allowance being made for the Causes of Death not specified.

Class of Diseases was lowest in Edinburgh, and highest in Dundee. Thus, assuming the same proportion of persons living as in Table XXXIV., viz., 100,000 in each Town, their died from the Zymotic Class of Diseases in the proportion of 472 in Edinburgh, 476 in Leith, 558 in Greenock, 569 in Aberdeen, 579 in Paisley, 581 in Glasgow, 646 in Perth, and 724 in Dundee.

Of the individual Zymotic Diseases, Small-pox caused only 766 Deaths, of which 415 were males and 351 females. This gives the very small proportion of 26 Deaths from Small-pox during the year in every 100,000 persons, being in the proportion of 30 male and 22 female Deaths in every 100,000 of either sex.

Measles caused only 971 Deaths in Scotland during the year, being in the low proportion of 33 Deaths in every 100,000 persons of the population. This year, also, has therefore presented a corroborative proof of the correctness of the remark made in former Reports, as to the close relation between Small-pox and Measles; inasmuch as both seem to be under the same unknown atmospheric or other influences, so that the one increases and declines along with the other. In 1860, the mortality from both was high, inasmuch as there were 1495 Deaths from Small-pox, and 1587 from Measles; while

This Table may be read without the decimals, thus: In every 100,000 persons living in each Town there died from Small Pox 33 in Glasgow, 26 in Edinburgh, 164 in Dundee, 36 in Aberdeen, etc. The Proportion in every 10,000 inhabitants is proved by dropping the last figure of each column.

in 1861, both were very low, only 766 Deaths from Small-pox, and 971 from Measles having occurred.

Scarlatina is in general the most fatal of the Epidemic Diseases of childhood, but during 1860, the mortality was below the average, seeing that only 1764 deaths were attributed to it, or in the proportion of 60 Deaths during the year in every 100,000 persons. During 1859, 126 Deaths, and during 1860, 101 Deaths from Scarlatina occurred for every 100,000 persons.

Diphtheria, since it made its appearance in Scotland in 1857, has steadily increased, year after year. Thus, in 1857, the Deaths from that Disease numbered 76 only; in 1858, they were 294; in 1859, they were 515; in 1860, they numbered 480; but in 1861, they had increased to 681; and thus constituted a fraction more than one per cent. of the Deaths.

Hooping-cough proved fatal to 2204 persons, of whom 989 were males, and 1215 females, being in the proportion of 71 males, but 78 female Deaths in every 100,000, of the respective sexes. Hooping-cough is therefore one of the few Diseases which prove less fatal to the male than to the female; and this peculiarity is apparent from year to year.

Though a small number of cases of Diarrhœa and Dysentery are constantly occurring among the population, yet these Diseases, with Cholera, only become prevalent during the Summer or Autumnal months when the temperature is high; their prevalence and fatality rising and falling with the temperature. During the year 1861, however, the temperature never rose high, the highest mean monthly temperature, viz., 57°·4, having been attained in August, while that of July was only 56°·8 and that of September 53°·7. The consequence of this was that only 1041 Deaths were caused during the year by Diarrhœa, 361 by Dysentery, and 67 by Cholera, being an aggregate proportion of 49 Deaths from these Diseases in every 100,000 persons.

Typhus, in its varied forms, was the most fatal Epidemic of the year, having cut off 2579 persons, or, including the 45 Deaths from Infantile Remittent Fever, which is only a form of Typhus, 2624 Deaths. This gives the proportion of 89 Deaths in every 100,000 persons, or 4·2 per cent. of the Deaths. This Disease, like all the others to which the inhabitants of Scotland are liable, proved most fatal to those in the Town Districts. Thus, in every 100,000 persons in each of the three Great Groups of Districts, Typhus cut off 56 persons in the Insular, 83 in the Mainland-Rural, and 101 in the Town Districts. But the Eight Principal Towns presented great variety in the proportion of persons who died from Typhus Fever. Thus, for the sake of comparison, assuming the population of all at 100,000, Typhus cut off 55 in Leith, 61 in Perth, 66 in Edinburgh, 82 in Aberdeen, 94 in Paisley, 95 in Dundee, 124 in Glasgow, and 136 in Greenock. Nowhere, however, did the Disease appear to assume the Epidemic type; but everywhere, like all other Diseases, it proved most prevalent and fatal among those whose health had been previously reduced by living in close, unaired, over-crowded dwellings, or in unhealthy, damp, undrained localities.

Of the other Zymotic Diseases, Croup caused 890 Deaths; Erysipelas, 253; Influenza, 232; Metria or Child-bed Fever, 203; Purpura, 49; Syphilis, 122, of which 88 were congenital; Worms, 30; Thrush, 25; Noma, 12; Ague, 6, from the Disease caught abroad, not in Scotland; and Hydrophobia, caused 1 Death.

Class II. *Diseases of Uncertain Seat.*

The Diseases of Uncertain Seat cut off 2319 persons in Scotland during 1861, or in the proportion of 79 Deaths in every 100,000 persons in the population. Dropsy and Cancer are the principal Diseases tabulated under this Class; the cases of Dropsy being those in which the seat of the Disease, or its primary cause, had not been defined. 778 Deaths were attributed to Dropsy, being in the proportion of 26 Deaths in every 100,000 persons. Cancer caused 1165 Deaths, of which only 367 were males, but 798 females. Thus showing that only 26 males, but 51 females died from Cancer during the year in every 100,000 of each sex. Females are therefore twice as liable to that painful Disease as males. It would appear that the mortality from Cancer maintains the same ratio in the Insular, the Mainland-Rural, and the Town Districts, as the Deaths from all causes, as is apparent from the fact, that in every 100,000 persons in each of these Groups or Districts, 27 died from Cancer in the Insular, 39 in the Mainland-Rural, and 41 in the Town Districts.

Of the other Diseases belonging to this Class, Mortification cut off 115 persons; Abscess, 126; Hæmorrhage, the seat of which was not defined, 65; Ulcer, 35; Fistula (all kinds), 19; and Gout, 16 persons.

Class III. *Tubercular Diseases.*

During 1861, the Tubercular Class of Diseases (which is composed of Scrofula, Tabes Mesenterica, Phthisis or Consumption, and Hydrocephalus) cut off 10,582 persons; thus constituting 17·79 per cent. of the Deaths, or in the proportion of 362 Deaths in every 100,000 persons in the population.

Of the 10,582 persons who died from this Class of Diseases, 5189 were males, and 5393 females, giving the proportion of 375 male Deaths, but only 349 female Deaths in every 100,000 persons of the respective sexes. This great excess of male Deaths is chiefly caused by the much greater fatality from Hydrocephalus which attends the male; for, in the Deaths from Phthisis, the proportion of female Deaths is higher than that of the male.

This Class of Diseases being Diseases of Debility, the mortality therefrom falls with especial severity on the Town populations, in a much greater ratio, indeed, than that of all other Diseases. Thus, while in every 100,000 persons living in each of the Three Great Groups of Districts, only 249 died from this Class of Diseases in the Insular, and 292 in the Mainland-Rural Districts, the proportion rose to 482 Deaths in a like population in the Town Districts. This fact would seem to prove that this class of Diseases is a much surer test of the sanitary condition of a Town or District than Epidemics, which are irregular in their appearance, and are often absent for years running from a District which is in a truly bad sanitary condition. The mortality, however, from this Class of Diseases, proves the true sanitary condition of a Town or District, because the Diseases belonging to this Class are mainly the result of causes which impair the vital energy and cause tubercular matter (*i.e.*, imperfectly oxygenized matter) to be deposited in the tissues of the body.

In the Eight Principal Towns of Scotland, the mortality from this Class of Diseases greatly differs. Thus, for correct comparison, reckoning the population of each Town as 100,000 persons, out of that number there died from the Tubercular Class of Diseases, 348 in Leith, 352 in Perth, 436 in Dundee, 447 in Edinburgh, 454 in Aberdeen, 491 in Paisley, 549 in Greenock, and 569 in Glasgow. A five years' average, however, gives a more correct view of the comparative liability of each Town to that Class of Diseases. A five years' average shows that in proportion to every 100,000 persons, 335 Deaths from the Tubercular Class of Diseases occurred annually in Leith, 416 in Perth, 457 in Edinburgh, 473 in Dundee, 501 in Aberdeen, 517 in Paisley, 564 in Greenock, and 567 in Glasgow.

Phthisis, or Consumption, is the most fatal of the Diseases which belong to this Class, and is also the most fatal of the individual Diseases to which the inhabitants of Scotland are liable. During the year, there died 7571 persons from this disease in Scotland; and if 366 be added to that number as the proportion of persons whose cause of Death was not recorded, the total mortality from Consumption would amount to 7937 Deaths, indicating a proportion of 259 Deaths during the year in every 100,000 persons. Of the 7571 recorded Deaths from Consumption, 3518 were those of males, 4053 those of females; indicating a proportion of 254 male Deaths, but of 263 female Deaths, in every 100,000 of either sex. As a like result appears year after year, it may be considered as demonstrated that females die from that disease in greater proportions than males—a result which might be expected, when it is considered that the disease is one essentially of debility, mal-assimilation of the food, and deficient oxygenation of the blood.

The fact, however, that females are more liable to the Disease than males, and die in larger proportions, is generally ignored by writers on sanitary matters. It is necessary, therefore, to direct special attention to the subject, as it has most important bearings on the causes of the Disease, and on the means which ought to be adopted for its prevention, alleviation, or cure. Thus, if the male and female Deaths from Consumption had borne the same relation to each other as the male and female Deaths from all Diseases, there ought to have been 3580 female Deaths from Consumption for the 3518 male Deaths. Instead of this, however, there were 4053 female Deaths, or 473 more female Deaths than ought to have occurred had Consumption cut off each sex in the same proportion as all Diseases did. Now, this is not an exceptional case, but is the ordinary law of this Disease in Scotland, as was pointed out in last Detailed Report. As comparatively few women, in proportion to the men, follow those unhealthy trades which sanitary writers endeavour to prove are the fruitful causes of Consumption, it is apparent that it cannot be the trade or occupation which is the cause of such a great preponderance of female Deaths from Consumption in Scotland. The fact of the great mass of the female population being more or less engaged in domestic or other pursuits which confine them to the locality in which their dwellings are situated, seems to indicate that the greater proneness of the female to Consumption, to a great extent depends on the locality or dwelling itself. The males, from being less constantly in the locality, suffer rather less than the females, who are more constantly at home.

If such be the case, as these statistics seem to show is extremely probable, they go far to corroborate the conclusions which Dr Bowditch of Boston, U.S., has drawn from a very thorough inquiry into one of the

causes of Consumption in Massachusetts.* It must be remembered that Consumption is much more fatal in Massachusetts, and the United States of America generally, than in this country; and on investigation, it was found that the towns, villages, hamlets, and houses which were situated on or near undrained localities, or were on heavy, impermeable soils, or on low-lying ground, and whose sites were consequently kept damp, had a very much larger number and proportion of cases of Consumption than towns, villages, hamlets, or houses which were situated on dry or rocky ground, or on light, porous soils where the redundant moisture easily escaped.

Let us see how such an explanation would agree with the very different proportion of Deaths from Consumption which occur in the Eight Principal Towns of Scotland. Taking a five years' average (1857 to 1861 inclusive), it is found that, supposing all these Towns are brought to an uniform population of 100,000 persons, there died annually from Consumption 206 persons in Leith, 298 in Edinburgh, 310 in Perth, 332 in Aberdeen, 340 in Dundee, 383 in Paisley, 399 in Glasgow, and 400 in Greenock. The fact is, that if each Town had been arranged in the order of comparative dryness of its site, they would almost have arranged themselves in the above position—Leith and Edinburgh the most free from Consumption, and also having the driest sites; Glasgow and Greenock the most ravaged by that Disease, and beyond all comparison situated on the dampest sites. The above fact, then, with regard to the Towns, corroborates, in the most striking manner, the conclusions of Dr Bowditch, and should be a valuable help to the sanitary reformers, as to the very important measures which it is their more especial province to carry out. Dr Bowditch's conclusions also are singularly borne out by the remarkable freedom from Consumption at the Cape of Good Hope and South Africa generally, Egypt, etc., and the comparatively high mortality from it in the moist climate of Great Britain; and while they point out the cause, afford valuable indications as to the cure or relief of those affected.

Of the other Tubercular Diseases, Scrofula cut off 699 persons, Tabes Mesenterica 782, and Hydrocepalus 1530, being in the respective proportions of 23, 26, and 52 Deaths in every 100,000 persons of the population. Hydrocephalus is proportionally much more fatal to the male than to the female, inasmuch as 859 of the Deaths from that Disease were males, and only 671 females, giving the proportion of 62 male Deaths, but only 43 female Deaths, in every 100,000 of each sex. This proves that even at the earliest ages of life the tendency of the male to Disease of the Brain is much greater than that of the female.

Class IV. *Diseases of the Brain and Nervous System.*

Diseases of the Brain and Nervous System proved fatal to 4823 persons in Scotland, being in the proportion of 164 Deaths from that Class of Diseases in every 100,000 persons. Of these 4823 persons, 2546 were males, and 2277 females; thus showing, that in every 100,000 of each sex, 184 males, but only 147 females perished from that Class of Diseases. This high relative proportion of male Deaths, which is reproduced year after year, shows the much greater tendency of the male to Diseases of the Brain. It is a very much higher proportion than is due to the different Death-rates

* Consumption in New England, or Locality one of its chief causes. Boston, 1862.

of males and females by all Diseases; and, as was pointed out above, is still more striking if the child's Disease Hydrocephalus be included, showing that, even at the earliest age, almost before either sex begins to use the Brain, the tendency in the male to die from its Diseases is much greater than in the female.

Like all other Diseases, however, the mortality from the Brain Diseases is highest in the Town Districts. Thus, in every 100,000 persons in each of the Three Great Groups of Districts into which Scotland is divided, 87 died from Brain Diseases in the Insular Districts, 143 in the Mainland-Rural, and 208 in the Town Districts. Of the Eight Principal Towns of Scotland, Paisley, and then Glasgow, yielded the lowest proportion of Deaths from Brain Diseases; Perth, then Edinburgh and Greenock, the highest.

Of the individual Diseases under this Class, Apoplexy caused 1008 Deaths; Paralysis, 1458; Convulsions, 689; Epilepsy, 213; Cephalitis, 354; Insanity, 91; Delirium Tremens, 54; Tetanus, 44; Chorea, 14; while 896 were registered under the indefinite term of Brain Disease.

Class V. *Diseases of the Heart and Organs of the Circulation.*

2491 persons died from Diseases of the Heart and of the Organs of the Circulation, of whom 1278 were males, and 1213 females. This gives the proportion of 92 male, and 78 female Deaths in every 100,000 persons of either sex in the population.

Of the individual Diseases under this Class, Heart Disease cut off 2350 persons, Pericarditis 72, and Aneurism 69 persons.

Class VI. *Diseases of the Respiratory Organs.*

According to our present mode of classifying Diseases, the Inflammatory Affections of the Respiratory Organs form the third most fatal Class of Diseases to which the inhabitants of Scotland are liable, and cut off, during the year, 8400 persons, of whom 4427 were males, and 3973 females. This gives the proportion of 287 Deaths in every 100,000 persons of the general population, or 320 male Deaths, and 257 female Deaths in every 100,000 of either sex. This mode of classifying the Diseases, however, gives a false idea of the relative prevalence of Diseases which prove fatal by affecting the Lungs and Respiratory Apparatus. In this country the great proportion of cases of Hooping Cough which prove fatal, do so through Inflammatory Affections of the Bronchial Tubes or of the Lungs. Croup also is confined to the air-passages; and all cases of Consumption prove fatal through the alteration which that Disease effects on the Lungs and Bronchial Tubes. In considering the proportion, therefore, in which Diseases of the Respiratory Organs bear to the other Diseases to which the natives of Scotland are liable, all these Diseases ought to be classed together; and we then arrive at a just conclusion as to the organ of the body which is most liable to become deranged in its action, and to bring Disease and Death on the population. When the 2204 Deaths from Hooping Cough, the 890 from Croup, and the 7571 from Consumption, therefore, are added to the 8400 Deaths belonging to this sixth Class, we have a total of 19,065 Deaths caused by Diseases of the Respiratory Organs. This shows that 32 per cent. of the ascertained Diseases affect the Respiratory

Organs, or that a third of the population die through maladies affecting these organs.

This striking fact shows us, that what we have chiefly to guard against in this climate are the causes which induce Disease in the Respiratory Organs; and it has been shown again and again in these Reports, that the chief of these causes are the low temperature of winter, and the keen, arid, easterly winds at all seasons, but more especially in spring. The Diseases of the Respiratory Organs are so strongly influenced by season, that their mortality appears to be quite regulated by the mean monthly Temperature —as an ordinary rule the mortality therefrom being lowest in August, our mildest month, and highest in January or February, our coldest months. Thus, in the Eight Principal Towns of Scotland, August was the warmest month of the year, and during that month 155 Deaths from Diseases of the Respiratory Organs occurred. January was the coldest month, and during that month 666 Deaths from the same causes were registered, and the other months had each a mortality corresponding closely with their mean Temperature.*

Of the individual Diseases belonging to this Class, Bronchitis is by far the most fatal, having caused 5017 Deaths, or, allowing for the causes not specified, in the proportion of 171 Deaths during the year in every 100,000 persons of the population, or nearly 8½ per cent. of the total Deaths. Of these, 2541 were males, and 2476 females. Thus showing a proportion of 183 male Deaths, and 160 female Deaths in every 100,000 of each sex.

Pneumonia, or Inflammation of the Lungs, was the next most fatal of the Diseases belonging to this Class, causing 1974 Deaths—being in the proportion 3·3 per cent. of the total Deaths, or 67 Deaths in every 100,000 persons of the population. This Disease seems to prove much more fatal to the male than to the female, inasmuch as 1139 of the Deaths were males, and only 835 females, giving the proportion of 82 male, but only 54 female Deaths in every 100,000 persons of each sex for Pneumonia.

Of the other Diseases belonging to this Class, Asthma cut off 661 persons, Pleurisy 268, Laryngitis 161; while 319 were registered under the indefinite term of Disease of the Lungs.

Class VII. *Diseases of the Organs of Digestion.*

Diseases of the Organs of Digestion caused 5036 Deaths, being in the proportion of 172 Deaths in every 100.000 persons, or 8½ per cent. of the total mortality. These Diseases cut off the respective sexes in very nearly the same proportions as all Diseases do, inasmuch as 184 males, but only 161 females were cut off by these Diseases in every 100,000 of each sex.

Of the various Diseases arranged under this Class, Teething caused 1137 Deaths; Enteritis, 947; Disease of Stomach, not more particularly defined, 765; Ileus, 293; Peritonitis, 298; Gastritis, 152; Ulceration of the Intestines, 183; Disease of the Liver, 572; Hepatitis, 166; Jaundice, 185; Hernia, 110; Quinsey, 87; Ascites, 61; Intussusception, 33; Stricture of Intestines, 24; Disease of Spleen, 22; and Disease of Pancreas, 1.

Of the other Classes of Disease, those of the Urinary Organs (of which the various Kidney Diseases are the chief) caused 844 Deaths; Diseases

* See Supplement to the Monthly Returns of the Births, Deaths, and Marriages registered in the Eight Principal Towns of Scotland. Year 1861. Table IV., p. 6.

of the Generative Organs (of which Child-birth is the principal) caused 506 Deaths; Diseases of the Organs of Locomotion—as of the Bones, Joints, Muscles, etc., including Rheumatism—caused 428 Deaths; Diseases of the Skin, 72 Deaths; Malformation from Birth, 152 Deaths; Atrophy, 492 Deaths; and Sudden Death, where the cause was not ascertained, 105 Deaths.

The debility arising from Premature Birth, and from weakly constitutions at Birth, cuts off a very large proportion of Infants annually, 2880 Deaths having been registered during 1861, induced by these causes. This gives the high proportion of nearly 5 per cent. (4·84) of the Deaths as arising from debility of constitution at Birth.

A very large number of Deaths is annually assigned to Old Age, or decay of the physical frame without marked disease. During 1861, there were 5792 Deaths assigned to Old Age, or more than 9½ per cent. (9·74) of the specified causes of Death. The proportion of persons dying from Old Age is much higher in the Insular and Mainland-Rural Districts than in the Town Districts, because life wastes more rapidly in the Towns, so that fewer are left to sink under the infirmities of age. In every 100,000 living in each of these Districts, 379 Deaths from Old Age occurred in the Insular Districts, 222 Deaths in the Mainland-Rural Districts, but only 142 Deaths in the Town Districts.

To complete the review of the mortality of the Married females, it is necessary to notice the mortality among the mothers during the year 1861. During that year 105,724 mothers gave birth to 107,009 children; and of these 511 died in child-bed either almost immediately, as a consequence of convulsions, floodings, exhaustion, etc., or shortly after from Child-bed Fever (Metria). This gives the very low proportion of one Death among every 207 mothers who were confined during the year—a very much lower proportion of Deaths than occurs from almost any Disease.

Class XVI. *Violent Deaths.*

The number of Deaths caused by Violence or Accident, is more regular from year to year than almost any other cause of Death. The mortality of Diseases varies much from year to year, depending on season, abundance or scarcity of food, and many other causes; but the Deaths by Violence or Accident recur with a regularity truly startling. In 1861, there were 2089 Deaths attributed to Violence or Accident, giving the proportion of 71 Deaths in every 100,000 persons of the population, or one Death in every 1408 persons.

Of these Violent Causes of Death, 726 Deaths were caused by Fractures and Contusions; 467 by Drowning; 293 by Burns and Scalds; 102 by Suffocation; 78 by Intemperance or Alcoholic Poisons; 70 by Want of Breast-milk; 93 by Wounds; 44 by Poisoning; 34 by Exposure to Cold; 5 by Privation; 4 by Neglect; while in 124 cases the cause of the Accidental or Violent Death was not specified.

Of the above 726 Violent and Accidental Deaths, 121 were Suicides. Of these Suicides, 43 were by Hanging, 28 by Cut-throat, 22 by Drowning, 12 by Poisoning by means of laudanum or opium, 4 by other Poisons, 4 by Gunshot, 1 by Immolation on a railway, one by Opening an Artery at the wrist, while in six cases the cause of Death was not specified.

The accompanying Table shows the 16 Diseases which proved most fatal in Scotland and in England during the year 1861, arranged in the order of their respective fatality. They are interesting as showing, that even in countries so closely adjoining, the several Diseases to which the inhabitants of each are liable are under somewhat different conditions, and hence exhibit different results.

The Sixteen most fatal Diseases in SCOTLAND in 1861.

Diseases.	Proportion of Deaths to 100,000 living.
Phthisis	259
Old Age	198
Bronchitis	171
Debility, Premature Birth, Atrophy	114
Typhus and Infantile Fever	89
Heart Disease	76
Hooping-cough	75
Pneumonia	67
Scarlatina	60
Hydrocephalus	52
Paralysis	49
Cancer	39
Teething	38
Diarrhœa	35
Apoplexy	34
Measles	33

The Sixteen most fatal Diseases in ENGLAND in 1861.

Diseases.	Proportion of Deaths to 100,000 living.
Phthisis	261
Debility, Premature Birth, Atrophy	185
Bronchitis	155
Old Age	137
Convulsions	127
Pneumonia	115
Diarrhœa	94
Heart Disease	86
Typhus & Infantile Fever	77
Hooping-cough	61
Paralysis	49
Scarlatina	45
Measles	45
Apoplexy	44
Hydrocephalus	38
Cancer	36

As the English Tables tabulate Atrophy along with Debility from a weakly constitution at birth, and separately tabulate the cases of Debility in which the birth was premature, in order to make the Tables comparable, all these are classed under one head in each Table. Atrophy, however, is really a distinct Disease.

INFLUENCE OF EXTERNAL AGENCIES.

Science has as yet failed to trace the cause to which is owing an increase of Births above the mean during one year, and a falling below the mean during another. The slight fluctuation in the annual number of Marriages would fail to account for it. But though man is more independent of the seasons than other animals, the influence of season on the monthly number of Births is quite marked, showing that even man has a tendency to bring forth his young during the spring months, which is the only birth period of the lower animals. Table XXXVII. shows this fact for the year 1861; and as the daily number of Births during each month shows this fact even better than by equalizing the months as to number of days, and making the mortality to correspond, that plan has been adopted for pointing out the influence of season on the Births during 1861. By that Table it will be seen that the months of April, May, and June exhibited the greatest number of Births daily; while January, September, and August exhibited the lowest numbers.

In former Reports it was pointed out that the influence of season on the number of Marriages in Scotland was inappreciable; but that that event was greatly influenced by the civil terms of Martinmas and Whitsunday, when engagements between masters and servants were loosened, and houses were

most easily procured. Table XXXVII. shows that fact, the number of daily Marriages being given, Sundays excluded, as no Marriages in Scotland are celebrated on that day. But there is one remarkable peculiarity in the Scottish people, and that is the fondness for marrying on the last day of the year. More Marriages are contracted in Scotland during the last day of the year than during any week of the year, excepting that week in which the 31st day of December occurs. Comparatively few of the Marriages which are contracted on that day are registered on that day, so that the very large number of Marriages contracted on the 31st December not being registered till January, makes it appear as if January were a favourite month for Marriage, while in reality it is not. In the Eight Principal Towns of Scotland alone, from 400 to 500 Marriages are contracted on the 31st of December annually; and as these towns embrace about a third of the Population of Scotland, it would be quite safe to assume that 1000 of the Marriages which are registered in the month of January, were really Marriages which occurred on the 31st of December. For instance, in Glasgow in 1861, 201 of the Marriages registered during the first week of January occurred on the 31st of December. If the necessary correction, therefore, were made in the above Table, it would make the daily number of Marriages to average only 43 in January, but 143 in December, and thus correctly show December and June to be the months during which the greatest number of Marriages is contracted in Scotland. Thus the largest number of Marriages follow the months in which the respective Civil Terms occur.

The influence of season on the Deaths has been so fully commented on in former Reports, that it seems unnecessary to repeat what has been already stated, seeing the same remarks would apply generally to 1861 as to former years. Each year, however, so far exhibits its own peculiarity; though all are seemingly subject to the same general law, that the mean temperature is the chief element which regulates the mortality of all Diseases. Thus, in 1861, January was the coldest month of the year, the mean temperature being 36°·3, and the daily Deaths were 226 in number. During February the mean temperature was more than three degrees higher, and the daily Deaths fell to 186. A new element, however, came into play during the next three months, counteracting to a great extent the beneficial effects which would follow the increasing temperature. The noxious east winds blow during these months; and though the sun's rays are more powerful, and the mean temperature much higher, these cold drying winds kept up the mortality, so that nearly the same number of Deaths occurred during each of

TABLE XXXVII.—Daily Number of Births and of Marriages in Scotland in each Month of the Year 1861. To show the influence of Season on the Births, and that of the Civil Terms on the Marriages.

these months. Thus, March, with its mean temperature of 41°·1, had 185 Deaths daily; April, with its mean temperature of 45°·4, had 183 Deaths daily; while May, with its high mean temperature of 49°·1, had 182 Deaths daily;—to such an extent was the beneficial influence of a higher mean temperature counteracted by the noxious influence of the arid, cold, easterly breezes.

After May the daily Deaths fell to 160 during June, and remained at the same number during July; but fell to 143 Deaths during August, and attained their minimum, viz., 134 Deaths daily, during September. The fall of temperature after that period increased the Deaths, so that October, with its mean temperature of 49°·5, yielded 139 Deaths daily; November, with its mean temperature of 38°·5, furnished 172 Deaths daily; and December, with its mean temperature of 38°, exhibited 180 Deaths daily.

But the Meteorology of the year in Scotland was somewhat remarkable, more especially as the weather presented a striking contrast to that which prevailed in England and on the Continent of Europe. England and the Continent of Europe, during that year, suffered from a drought which was very severe and destructive in France, and less so, but quite marked, in England; while Scotland, at the same time, was suffering from unusual inundations and unprecedented wet weather. Thus, in France, the drought was so severe as seriously to injure the crops, and cause apprehensions of a famine. In England, the humidity of the air was less than usual, there was considerable drought, and the rain-fall was only 20·80 inches, or much less than usual; while in Scotland, not only was the humidity of the air greater during the whole year, but the rain-fall was greatly in excess, amounting to 45·07 inches during the year. The average rain-fall of the five previous years had only been 34·50 inches in Scotland, so that the rain-fall was excessive, whether contrasted with that of previous years, or with that which fell in England, and on the Continent of Europe, and more especially in France, and the Southern States of Germany and of Austria. The fall of rain, indeed, in some parts of Scotland, was quite tropical in amount during 1861. Thus, at Wanlockhead, in Dumfriesshire (wanting the fall in July, which would have added six or seven inches at least), the rain-fall during 11 months amounted to 73·64 inches. At Stronvar, in Perthshire, the rain-fall

TABLE XXXVIII.—Daily Number of Deaths in Scotland during each Month of the Year 1861, to show the Influence of Season, but especially of Mean Temperature, on the Mortality.

amounted to 86·15 inches; at Portree, in the Isle of Skye (deficient in the Returns for January), the rain-fall for 11 months amounted to 125·79 inches; while at Tyndrum, in Perthshire (unfortunately wanting the Returns for April), 11 months fall of rain afforded the enormous depth of 134·50 inches of water.

Attending this moist state of the atmosphere, and excessive fall of rain, there was a greater amount of cloud than usual, and a consequent deficiency of sunshine. Though this circumstance prevented the mean temperature during the day rising so high as usual, it prevented the night being so cold; as these clouds, in consequence of covering more of the sky during night, pre-

TABLE XXXIX.—METEOROLOGY OF SCOTLAND for 1861, deduced from Observations made at 53 Stations of the Meteorological Society of Scotland, the particulars for each of these Stations having been published in the Quarterly Reports of the Registrar-General for 1861.

vented the loss of heat by radiation from the earth's surface being so great. The consequence of this was that the mean temperature of the year was slightly above the mean of the five previous years, and the daily variations of temperature were smaller than usual.

Conjoined with these meteorological phenomena was an unusual prevalence of strong breezes from the south-west; and storms of wind, which committed great devastations at sea, were more numerous than usual.

It may now be considered as a proved fact, that in Scotland, damp rainy weather, such as was experienced during the whole of 1861, tends to decrease the number of Deaths, while extremes of heat, and especially of cold, tend powerfully to increase them. It is very questionable, however, whether a continuance of such weather be equally conducive to health; nay, it is the general belief, founded on observation, that the amount of sickness, though not of so fatal a character, is greater during damp, moist weather, than it is when the weather is dry and frosty. Heavy falls of rain, however, when they occur in the summer or winter, are most valuable agents in purifying both the atmosphere and the ground; while in Towns, by washing out the drains, streets, and narrow lanes or closes, they act as most effective sanitary agents. It is, indeed, a proved fact that heavy

TABLE XL.—Showing the Revenue, Imports, Exports, the Quantity of Grains, Tea, Sugar, etc., imported into the United Kingdom; the average Price of the Chief Articles of Food in England, etc., during the years 1860, 1861, and 1862.

falls of rain, even in Intertropical Countries, cause an immediate and sensible diminution in the attacks of any epidemic disease which may be prevalent at the time; and diminish the mortality of the cases under treatment. Such appears to have been the effect of the heavy falls of rain in Scotland during the year 1861; and perhaps the small epidemic mortality, and the small number of Deaths from all diseases, may, to no small extent, be ascribed to these heavy falls of rain.

Table XXXIX. shows the meteorological phenomena in Scotland during the year 1861, deduced from observations made at 53 stations of the Meteorological Society of Scotland. From that Table it appears that the mean barometric pressure, corrected to 32°, and to the mean sea level, was 29·837 inches. The mean temperature was 46°·9; the mean daily range of temperature, 11°·6. The absolute highest degree of temperature in the shade during the year was 85°·5, and the absolute lowest —3°·7. The mean of all the highest day temperatures was 52°·7, and the mean of the lowest night temperatures 41°·1. The mean humidity of the air was 86; the number of days on which rain fell was 194, with a mean depth of 45·07 inches of water. The mean amount of cloud was 6·4. And the sun shone for 1674 hours. Easterly winds blew 86 days; westerly winds 186 days.

Table XL. shows some of the other external agencies which may be supposed to influence the Deaths and Marriages; as from it may be deduced the general state of the country as to the condition of its trade, manufactures, commercial prosperity, the supply and price of provisions, and the ability of the people to save from their earnings, and deposit their savings in banks. This table of itself refutes the theory which has been propounded as to the necessary connection between a high mortality and high-priced food. In 1860, a year of very high mortality, provisions were extremely cheap, the demand for labour great, wages very good, and yet these did not keep down the mortality. In 1861, provisions were up in price—the four-pound loaf, which in 1860 was 5d. and 6d., rose to 7d. The commercial atmosphere was disturbed by the breaking out of the American War; but notwithstanding this, the year was one of low mortality. The only connection which seems to exist between the high price and scarcity of provisions and a high mortality, is that both are probably dependent on one cause, when they co-exist; and that it is the weather which simultaneously affects the price and scarcity of provisions, and the mortality. When these two conditions, therefore, occur during the same year, the coincidence has been mistaken for the cause; and the increased mortality has been attributed to the high price and scarcity of provisions, while it was in fact due to the very same cause which led to provisions being scarce and high-priced.

I have the honour to be,

Sir,

Your most obedient Servant,

JAMES STARK.

* In all the Counties marked thus *, the number of Acres is given from actual survey by the Ordnance Staff; and these measurements were procured from the Ordnance Survey Office, through the kindness of Col. Sir Henry James. The measurements of the other Counties, with the exception of Shetland and Orkney, were taken from Major Dawson's estimate for the Census of 1851. In that estimate he included as land all the channels between the islands in Shetland and Orkney. These channels are excluded in the estimate given in the above Table.

CONSTITUTION OF THE COMPOUND DISTRICTS.

No.	District.	Component Parts (Parishes).
13	Birsay	Part of Harray & Birsay.
14	Deerness	Part of St Andrews.
15	Eday & Pharay	Part of Stronsay & Eday.
22	North Ronaldshay	Part of Cross & Burness.
26	Sanday	Lady, and part of Cross & Burness.
86*b*	Carloway	Parts of Lochs and Uig.
87	Lochs	Parts of Lochs and Uig.
112	Kilmuir	(1) Part of Kilmuir, (2) Rest of Kilmuir and part of Snizort.
135	Elgin	Elgin, and parts of New Spynie and St Andrews Lhanbryde.
147	Banff	(1) Burghal parts of Banff and Gamrie, (2) Rest of Banff.
152	Enzie	Parts of Bellie and Rathven.
167	Seafield	Parts of Cullen and Rathven.
222*b*	Millbrex	Parts of Fyvie and Monquhitter.
227*a*	New Machar	New Machar and part of Udny.
227*b*	New Pitsligo	Parts of Aberdour, New Deer, Strichen, and Tyrie.
237*b*	Savoch	Parts of Ellon, New Deer, Old Deer, and Tarves.
272	Arbroath	Arbroath, and part of St Vigeans.
282	Dundee	(1) Part of Dundee, (2) Rem. of Dundee, and part of Liff, Benvie, and Invergowrie, (3) Part of Liff, &c.
312	Montrose	Montrose, and part of Dun.
324	Aberfeldy	Parts of Dull, Fortingall, Kenmore, Logierait, and Weem.
333	Blackford	Blackford, and part of Ardoch.
344	Dowally	Part of Dunkeld & Dowally.
348	Dunblane	Dunblane, and part of Ardoch.
349	Dunkeld	Parts of Caputh and of Dunkeld & Dowally.
355*a*	Fortingall	Parts of Fortingall and Weem.
355*b*	Foss	Part of Dull.
360	Kenmore	Parts of Kenmore and Weem.
361	Killin	Parts of Kenmore, Killin, and Weem.
367	Kinloch-Rannoch	Parts of Fortingall and Logierait. [Redgorton.
375	Logiealmond	Parts of Fowlis-Wester, Little Dunkeld, Methven, Monzie, and
379	Meigle	Meigle, and part of Coupar-Angus.
386*a*	Muthill	Muthill, and part of Ardoch. [& Kinloch, and Rattray.
386*b*	Persie	Parts of Alyth, Bendochy, Blairgowrie, Caputh, Kirkmichael, Lethendy
387	Perth	Perth, and parts of Kinnoull, Scone, and Tibbermore.
394*b*	Strathfillan	Part of Killin.
394*c*	Tenandry	Parts of Blair-Athol, Dull, and Moulin.
423	Dunbog	Dunbog, and parts of Abdie and Flisk.
442	Kirkcaldy	Kirkcaldy, and parts of Abbotshall and Kinghorn.
490	Stirling	Stirling, and part of St Ninians.
493	Bonhill	Bonhill, and part of Dumbarton.
496	Dumbarton	Parts of Cardross and Dumbarton.
506	Ballachulish & Corran of Ardgour	Part of Kilmalie.
509	Cumlodden	Parts of Glassary and Inveraray.
515	Kilbrandon & Kilchattan	Kilbrandon & Kilchattan, and part of Jura.
526	Lochgilphead	Parts of Glassary and South Knapdale. [Knapdale.
535	Tarbert	Parts of Kilcalmonell & Kilberry, of Saddell & Skipness, and of South
536	Bowmore (or Killarrow)	Part of Killarrow & Kilmeny.
538	Iona	Part of Kilfinichen & Kilvickeon.
542	Kilfinichen & Kilvickeon	Parts of Kilfinichen & Kilvickeon, and of Torosay.
543	Kilmeny	Part of Killarrow & Kilmeny.
545	Kinlochspelvie	Part of Torosay.
546	Oa	Part of Kildalton.
547	Portnahaven	Part of Kilchoman.
548	Salen	Parts of Kilninian & Kilmore, and of Torosay.
549	Tobermory	Part of Kilninian & Kilmore.
556	Lochranza	Parts of Kilbride and of Kilmory.
557	North Bute	North Bute, and part of Rothesay.
559	Abbey	(1) Parts of Abbey and Renfrew, (2 & 3) Rest of Abbey.
578	Ayr	Ayr, and parts of Newton-upon-Ayr, and of St Quivox.
595	Irvine	Irvine, and part of Dundonald.
612	St Quivox, &c.	Parts of Newton-upon-Ayr, and St Quivox.
626*b*	Calderhead	Parts of Cambusnethan and Shotts.
644	Glasgow	City of Glasgow, including Gorbals and parts of Barony and Govan.
670	Queensferry	Queensferry, and part of Dalmeny.
684	Portobello	Parts of Duddingstone and South Leith.
685	Edinburgh	City of Edinburgh, including Canongate and parts of St Cuthberts, Duddingstone, Liberton, and South Leith.

* The actual number of Districts is 1010—many Parishes and Burghs having been divided into two or more Districts for the purposes of Registration. Thus Edinburgh and Glasgow, to each of which only a single number is assigned in the Tables, consist of 5 and 10 Districts respectively. In forming the alphabetical arrangement, the principle adopted has been to place *compound* names in the order in which they are pronounced.
